Funded by the Road Safety Trust

## Foreword

The NZ Travel Survey was a project initiated and funded by the New Zealand Road Safety Trust. Its aim was to update information on road crash and injury risk to allow accurate targeting of road safety strategy and initiatives. Approximately 14,000 people were interviewed from 7,000 randomly sampled households over the period of a year between June 1997 and July 1998 and during April and May 1999 (some Auckland households only).
This report provides a detailed description of the survey methodology together with tables of survey results including changes over the eight intervening years since the last travel survey of 1989/90-a project that employed comparable survey methods. A separate booklet, Travel Survey Highlights, presents a selection of Travel Survey results suitable for use by schools, universities and the general public. In contrast to that publication, this report has considerably more detail. The extensive tables and graphs provide highly valuable information for road safety professionals as well as for those involved in transportation planning.
The following statistics are examples of what can be found in the tables and graphs in this document:

- People are more mobile.

During the eight years from 1989/90 to 1997/98 driving has increased by 35\%; passenger travel by $14 \%$; bus travel by $16 \%$; time walking by $7 \%$; however, cycling has decreased by $19 \%$.

- People are very dependent on cars for mobility. $55 \%$ of all road travel was by car drivers (including van/ute) and $35 \%$ by car passengers.
- Driving is safer.

Where risk is expressed as the number of crash involvements per distance driven, the risk for car drivers of being involved in an injury crash has fallen by $38 \%$ between 1989/90 and 1997/98, as has the risk of involvement in a fatal crash. The largest improvements in risk have been for the young and the old.

- There are fewer older cars (including vans and utes) used by households. In 1989/90, of all cars used by households, $15 \%$ were $15-19$ years old and $19 \%$ were at least 20 years old. The respective figures for $1997 / 98$ are $13 \%$ and $17 \%$. However, there are proportionately more "middle-aged" cars and hence the average age of cars has increased by almost a year.
- Cars (including vans and utes) used by households are now more powerful. In 1997/98, $59 \%$ of household cars were over 1600cc. The corresponding figure in 1989/90 was only $47 \%$.
- There are significant differences between ethnic and gender groups in terms of percentages of people who are active drivers.
Of driving-age males identifying themselves as Pakeha or of European origin, an estimated $92 \%$ were active drivers, compared to $84 \%$ of Maori and $72 \%$ of Pacific descent. The corresponding figures for driving-age females are $85 \%$ for Pakeha/Europeans, $64 \%$ for Maori and only $53 \%$ for Pacific women.
- There are significant differences between ethnic groups in terms of injury crash risk. Compared to Pakeha/Europeans, the risks of being hospitalised as a result of a crash per distance driven was more than three times as high for Maori drivers and only slightly less than three times for Pacific drivers.
- Trips made at high drinking times of the week (10pm to 4am each night, plus 4am-6am on Fridays to Sundays) are more than ten times as likely to be made by drivers under the influence of alcohol than trips generally.
As details of alcohol consumed by drivers were also recorded by the travel survey, it could be estimated that $0.25 \%$ of all trips made by male drivers and $0.08 \%$ by female drivers (at any time of day or night) were made while the driver was over the legal alcohol limit. During the high drinking times mentioned above, the proportion increases to $2.7 \%$ and $0.9 \%$ for males and females respectively.

Firstly, thanks are due to the 14,000 respondents who freely gave their time to describe their own travel behaviour in considerable detail. I would also like to acknowledge the work of the LTSA Research and Statistics team led by Bill Frith, in particular the work of Lynley Povey and Mike Keall. This team designed and managed the survey and compiled this report as well as the Travel Survey Highlights booklet from their analyses of the data. Along with their survey team, I would also like to thank Elizabeth Ampt and Sue Riddle of Ampt Applied Research, who carried out the survey, Critchlow Associates who undertook the geocoding of trips, and Alan Wyllie who provided valuable advice regarding the measurement of alcohol consumption.

I trust you find this New Zealand Travel Survey Report informative and useful.

Reg Barrett
Director of Land Transport Safety Authority

## INTRODUCTION

## Survey description

## Purpose

The New Zealand Travel Survey provides data to assist in the development of policy and evaluation of programmes relating to road use and road safety. When combined with existing crash data, crash risks for different groups of road users (including drivers, passengers, pedestrians and pedal cyclists) can be estimated. To enable valid estimation of changes in risk and travel occurring over time, comparable survey methods were used to the previous national travel survey of 1989/90.
As travel behaviour has been shown to be strongly related to people's availability and willingness to be surveyed, personal interviews were used to gather travel data. This survey method generates the highest rate of co-operation and the most complete recording of complex travel behaviour.

## Procedure

An initial letter was sent from the Road Safety Trust to the households selected for interview. Included with this was a pamphlet briefly describing the aims and content of the survey. Next, the interviewer called at the address to gather household information, explain the purpose of the survey, tell the household which were their "travel days" (two consecutive days for which the household was to record all travel), and leave a memory-jogger for the respondents to use for recording travel. Finally, as soon as possible after the travel days, the interviewer returned to conduct the interviews.

## Questionnaire

As one of the objects of the survey was to compare 1997/98 travel with 1989/90 travel (estimated by the previous travel survey), essentially the same questionnaire was used as in the 1989/90 survey. There was the further advantage of using a survey instrument that had been extremely well tested and had performed well in the field previously. Minor changes were made to update wording and response categories. Major changes were made to the questions on alcohol consumption so that estimates could be made of actual quantities drunk. These were made with the assistance of Alan Wyllie, Assistant Director of the Alcohol and Public Health Research Unit, Auckland University.
All responses were treated as confidential and the computerised data file contained no information that could identify individual households or respondents.

## Data gathered

There were two questionnaires used: one to gather information about the household and another for individual travel, demographics, alcohol usage, etc. In addition, the interviewers had show cards for coding occupation, driving experience, ethnicity, income, drinking venue and types and quantities of alcohol consumed. The questionnaires and show cards can be found in Appendix G.

The following data were gathered (or were derived from responses):
Household:
Local Government Region of respondent's residence, urbanisation of respondent's residence, household structure, relationship of people in the household, number of people, number and type of household vehicles (car, motorcycle, van etc.), vehicle make and model, vehicle age, engine capacity and ownership, and response status of household.

Person:
For each person in the sampled household - relationship to nominal "head" of household, gender, age, employment, income, driving experience, number of road crashes, number of trips, ethnicity, whether they drank alcohol on travel days, and location of workplace/school.
Trip:
For each trip made by sampled people on the travel days - trip purpose, mode (as driver/passenger/pedestrian/cyclist etc), date, time, origin and destination grid references, numbers of people in the vehicle, and which household vehicle was used (linked to information on vehicle make and model, vehicle age, engine capacity, ownership). For walking trips no distance estimates were recorded because people generally find these difficult to estimate accurately and the digitised distance calculation designed for road travel was not well suited to pedestrian travel. Duration of the walking trip and the number of roads crossed were recorded instead.
Alcohol drinking sessions:
For each person - times, locations and types and amounts of alcohol consumed.
Traffic crashes:
For each person - crash involvement over the last two years, location of crashes, and type of crash.

## Piloting and testing

A pre-pilot or "skirmish" plus a larger scale pilot were used to test and refine the survey forms (particularly the questionnaires) and procedures. A skirmish was run very early in the project to test the wording of the questionnaires, using a small sample of households, including the extremes in socio-economic levels. The results of the skirmish led to minor changes in question wording. The pilot test was essentially a dress-rehearsal of the main survey, used to test the interviewing procedures, the adequacy of the training, the field work, and validation interviews as well as to examine the response rates.

## Interviewers' training and supervision

All interviewers underwent a three-day training session after completing an extensive home study exercise. This was necessary as the travel behaviour being recorded was relatively complex and the interviewers needed to be well-acquainted with the 60-page interviewers' manual. They were personally supervised once during the training (which involved carrying out actual Travel Survey interviews), once during their first week of interviewing and once (at random) after that. Checks were also made of $10 \%$ of each interviewer's questionnaires that the surveyed household had actually been visited by the interviewer and that each respondent had in fact been interviewed personally, and one or two items of data were also
checked. A supervisor also visited three households from each interviewer's workload and checked data from the questionnaire with the residents.

## Sample design

## Stratification

The sample strata and substrata were geographically based using Statistics NZ definitions for the 1991 Census of Population and Dwellings ${ }^{1}$ : the strata were the 14 Local Government Regions, further stratified into Main Urban Areas (at least 30,000 population), Secondary Urban Areas (population between 10,000 and 30,000 ) and rural (including Minor Urban Areas with population less than 10,000 and all other rural areas).

The sample sizes per Local Government Region were proportional to 1991 Census populations except for the following:

- Less than proportional: Auckland (69\% of proportional), Canterbury (83\%), Wellington (92\%);
- More than proportional: Hawkes Bay, Nelson-Marlborough, Northland, Southland, Taranaki, Gisborne and the West Coast Regions.
These departures from proportional sampling were necessary to ensure a minimum sample size per Region (so the smaller Regions were allocated some of the sample size of the larger Regions). All the Major Urban Areas (population greater than 50,000 ) and Local Government Regions were surveyed throughout the entire year, so estimates could be made of annual travel for these cities and Regions. Some parts of Auckland were surveyed during the months of April and May 1999 to replace unreliable data collected during the previous year.

## Sample frame and sampling method

Survey costs were minimised (while maximising the utility of the data collected) by constructing the survey so that interviewers did not need to travel long distances between households. Meshblocks (geographical units varying in size from a city block in urban areas to extensive tracts of land in rural areas) were used as the first stage sampling units and were sampled independently within the strata. The sampling frame for meshblocks consisted of the 1991 Census list of meshblocks. The meshblocks were sampled with probability proportional to size without replacement ${ }^{2}$ where size was defined as 1991 Census population. To compile an up-to-date sampling frame of households within the sampled meshblocks, these meshblocks were visited and all dwellings were listed together with street addresses.

Meshblocks were surveyed in random order within Regions. In urban areas, one in eight households from sampled meshblocks was sampled. A higher proportion (one in seven) of households within most rural meshblocks was sampled to ensure that an adequate sample of rural households would be available for comparing rural with urban travel. As high travelling costs were associated with the more distant rural areas, such areas were sampled with a lower sampling fraction of one in eight households. A systematic sample of households was taken by randomising a list of all households within sampled meshblocks and sampling every

[^0]seventh or eighth household from this list. Although this procedure can lead to a slightly variable sample size per meshblock, the households within the next meshblock were systematically sampled as though the list were continuous (so, for example, very close to one eighth of all households were sampled in urban areas). This method of sampling is almost identical with simple random sampling without replacement. Introductory letters were sent to a computer-generated list of households prior to the interviews of household members. Sampled households and household members from whom responses could not be obtained were not replaced by other respondents, but were imputed for using data obtained from other similar respondents (see below).

## Allocation of travel days

The households selected according to the sampling scheme were each allocated two consecutive travel days (i.e. days about which the household members should report their travel). The travel days were allocated to the sample of households in a fashion that maintained a wide geographical spread (of areas being surveyed) at any given time of the year but was compatible with a restricted number of survey interviewers, each surveying at a rate of approximately three households per day. An even spread by day-of-week was maintained by systematic allocation of travel days.

## Coverage

The sampling frame consisted of all New Zealand households, excluding some sparsely populated remote areas in Westland, East Coast of the North Island, Southland and Northland. Holiday homes were not included in the sampling frame to avoid higher sampling probabilities (leading to biased estimates) for people who own more than one house. Guests at hotels and motels were not surveyed as it was assumed that this group of people had a chance of being sampled at their home residence. There were also considered to be difficulties in gaining access to these people for interviews, particularly as the survey method required more than one visit (see above) and was not compatible with short stays at motels/hotels. Inmates of prisons and patients of hospitals were also not surveyed. However, staff residences of hotels, motels, prisons and hospitals were included in the sampling frame. Bias due to non-response was minimised by requiring a minimum of four attempts (made at different times of the day) to contact people who were not at home. Nevertheless, the failure to make contact with respondents who are not at home together with the exclusion of visitors and people staying at hotels/ motels (some research indicates that these people tend to travel more than the average), means that the estimates of distance travelled derived from this household survey may slightly under-estimate the total travel in New Zealand. However, this can be estimated from other sources.

There will also be some underestimation of travel by professional drivers (and hence by vehicles such as taxis and trucks). This is due to a combination of the household-based sampling that excluded accommodation used by long-distance drivers, and the likelihood that professional drivers would refuse to participate because of the demands of providing all trip details.

## Estimation of distance

The estimation of distance travelled is central to the calculation of exposure to crash risk, and hence the key variable of this survey. For all their recorded trips, respondents were asked to provide addresses of the origin and destination of each leg of the trip in a format that could be used in the automated calculation of trip distances. Critchlow Associates were contracted to generate automated map co-ordinates for each address and then to calculate distance based
on the shortest (in terms of travelling time) route between the origin and destination addresses. Some approximations needed to be used when a street number was not valid (the closest valid address was used) or did not exist (the mid-point of the street was used). Where a route was used that deviated from the shortest route (eg a scenic drive), the interviewers recorded an intermediate address along the route taken to show that a longer route was taken. A number of addresses that could not be automatically digitised (ie encoded as map coordinates) were digitised manually by referring to street maps. Where there was insufficient detail or errors in the recording of the address, the respondent's own estimate of the trip distance (which was recorded for all non-pedestrian trips) was used as the best distance measure. For pedestrians, the most commonly used exposure measures are time spent walking and number of roads crossed, both of which were recorded. Distance walked was not considered to be able to be calculated using the same algorithm as for driving or cycling, hence there was no distance measure calculated for pedestrian trips.

## Estimation of means and totals

Since the sample was not a simple random sample of the population, a simple mean or total of the sample observations was not appropriate for estimating population means and totals. Weighted means and totals were used, where the weights were approximately equal to the reciprocals of the probability of selection of the respondents. Weights were also used to reduce the inevitable bias due to non-response. The sampling weights, non-response imputation and post-stratification weights are described in more detail in Appendix A.

## Estimation of sampling errors

Sampling errors were calculated using the random group method. This consisted of dividing the sample into random groups (maintaining the sample structure in each group) and calculating estimates based on each resulting sub-sample. The sampling error was estimated from the variability between these random group estimates. Further details can be found in Appendix A.

## Crash and injury data

A number of tables in this report combine travel information with information about motor vehicle crashes. This is extracted from the Land Transport Safety Authority's database of coded information derived from Traffic Crash Reports.
When an injury crash is reported, it is usually attended by a police officer. The reporting officer's primary duties are to prevent further injury and to help those injured. The next duty is a legal one, to ascertain whether anyone involved in the crash has committed an offence. After dealing with these other duties, the officer completes a Traffic Crash Report. The Traffic Crash Report is examined and coded by traffic engineers and by administrative staff of the LTSA. This coded information is loaded on to a computer, edited and checked. Further details can be found in the annual summary of crash statistics, "Motor Accidents in New Zealand" (eg LTSA, 1999).
Hospitalisation data are used for tables of cyclist injuries in non-motor vehicle crashes and of risks for different ethnic groups. These refer to the number of people admitted to hospital as a result of a crash and are supplied by the New Zealand Health Information Service.

## HOUSEHOLDS IN THE SURVEY

## Analysis of household responses 1997/98 ${ }^{3}$

In total, 8079 addresses were surveyed. $915(11 \%)$ of these addresses were not permanently occupied dwellings. Full responses were obtained from 5367 ( $74.9 \%$ ) of the 7164 permanently occupied dwellings.

Table HH1: Households sampled

| Response | Addresses in <br> sample | \% of all <br> addresses | \% of eligible <br> households |
| :--- | ---: | ---: | ---: |
| Full response | 5367 | $66.4 \%$ | $74.9 \%$ |
| Partial response <br> (see note) | 296 | $3.7 \%$ | $4.1 \%$ |
| Non-response | 1501 | $18.6 \%$ | $21.0 \%$ |
| Total eligible households | 7164 | $88.7 \%$ | $100.0 \%$ |
| Sample loss (eg non-dwelling, dwelling <br> under construction, demolished, derelict <br> or vacant) | 915 | $11.3 \%$ |  |
| Total households in survey | 8079 | $100.0 \%$ |  |

Note: 'Partial response' refers to households in which some post-travel interviews were completed but in which one or more members refused or was unable to participate. (Households for which only the pre-travel interview was completed are classed as non-response).

Table HH2: Reasons for partial response or non-response

| Reason for partial response or non-response | Number of <br> households | Percentage <br> of eligible <br> households |
| :--- | ---: | ---: |
| Unable to contact dwelling occupants | 678 | $9.5 \%$ |
| Part non-contact with dwelling occupants (see <br> note) | 108 | $1.5 \%$ |
| Language problems | 29 | $0.4 \%$ |
| Death/ illness in household | 85 | $1.2 \%$ |
| Full refusal of household | 709 | $9.9 \%$ |
| Part refusal (see note) | 188 | $2.6 \%$ |
| Total | 1797 | $25.1 \%$ |

Note: 'Part non-contact' and 'Part refusal' refer to households in which some post-travel interviews were completed but in which one or more members refused or was unable to be contacted. (Households for which only the pre-travel interview was completed are classed as 'full refusal' or 'unable to contact dwelling occupants' as appropriate).

[^1]
## Table HH3: Sample sizes and response rates by Local Government Region

| Local Government <br> Region | Eligible <br> households | Response rate <br> (see note) |
| :--- | :---: | :---: |
| Northland | 326 | $94 \%$ |
| Auckland | 1273 | $67 \%$ |
| Waikato | 734 | $78 \%$ |
| Bay of Plenty | 462 | $71 \%$ |
| Gisborne | 253 | $67 \%$ |
| Hawke's Bay | 323 | $81 \%$ |
| Taranaki | 380 | $85 \%$ |
| Manawatu/ Wanganui | 454 | $82 \%$ |
| Wellington | 820 | $64 \%$ |
| Nelson/ Marlborough | 369 | $73 \%$ |
| West Coast | 204 | $73 \%$ |
| Canterbury | 827 | $78 \%$ |
| Otago | 403 | $73 \%$ |
| Southland | 336 | $84 \%$ |
| Total | 7164 | $75 \%$ |

Table HH4: Response rates for major household types and dwelling structures

| Household type | Dwelling structure |  |  |  |  |  | All dwellings (including unspecified) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Separate house |  | 2 flats/ houses joined together |  | 3 or more flats together |  |  |  |
|  | Sample size | Resp rate | Sample size | Resp rate (\%) | Sample size | Resp rate (\%) | Sample size | Resp rate (\%) |
| Person living alone | 803 | 89\% | 148 | 90\% | 135 | 78\% | 1100 | 87\% |
| Married/ de facto couple only | 1444 | 91\% | 70 | 80\% | 42 | 74\% | 1576 | 90\% |
| Single adults only | 203 | 71\% | 23 | 77\% | 20 | 56\% | 247 | 70\% |
| Family (including extended) with children | 1630 | 83\% | 29 | 69\% | 17 | 59\% | 1703 | 83\% |
| Family with adults only | 277 | 84\% | 8 | 67\% | 6 | 75\% | 293 | 83\% |
| Single adult living with children | 282 | 88\% | 20 | 87\% | 18 | 82\% | 325 | 87\% |
| All types (including unspec.) | 4754 | 77\% | 303 | 72\% | 240 | 64\% | 5367 | 75\% |

Note: 'Response rate', as in tables HH3 and HH4 above, is the percentage of eligible households from which all members provided travel information.

## PEOPLE IN THE SURVEY

## Survey Respondents

Table PE1: Age group and gender of survey respondents

| Age group | Male | Female | Total |
| :--- | ---: | ---: | ---: |
| $0-4$ | 567 | 586 | 1153 |
| $5-9$ | 714 | 620 | 1334 |
| $10-14$ | 621 | 530 | 1151 |
| $15-19$ | 410 | 422 | 832 |
| $20-24$ | 353 | 431 | 784 |
| $25-29$ | 391 | 502 | 893 |
| $30-34$ | 473 | 562 | 1035 |
| $35-39$ | 546 | 657 | 1203 |
| $40-44$ | 470 | 553 | 1023 |
| $45-49$ | 482 | 523 | 1005 |
| $50-54$ | 403 | 458 | 861 |
| $55-59$ | 365 | 355 | 720 |
| $60-64$ | 272 | 291 | 563 |
| $65-69$ | 269 | 296 | 565 |
| $70-74$ | 207 | 258 | 465 |
| $75-79$ | 147 | 205 | 352 |
| $80+$ | 129 | 176 | 305 |
| Unknown | 3 | 3 | 6 |
| Total | 6822 | 7428 | 14250 |

15-19 year olds

| Age group | Male | Female | Total |
| :--- | ---: | ---: | ---: |
| 15 | 88 | 91 | 179 |
| 16 | 95 | 92 | 187 |
| 17 | 96 | 80 | 176 |
| 18 | 59 | 77 | 136 |
| 19 | 72 | 82 | 154 |

Table PE2: Employment status of survey respondents

| Status (one or more may apply to <br> any individual - see Note) | Respondents <br> with this status |
| :--- | ---: |
| Not yet at school | 1130 |
| Student - full time | 3330 |
| Student - part time | 231 |
| Work - full time | 4515 |
| Work - part time | 1659 |
| Work - casual | 444 |
| Looking for work | 547 |
| Keeping house | 2459 |
| Retired/ aged pensioner | 2011 |
| Other pensioner | 239 |
| Other | 326 |

Note: the above categories are not mutually exclusive. For example, the same individual may validly be recorded as a full time student and a part time worker.

Table PE3: Occupations of survey respondents (main job)

| Occupation (Note 1) | Respondents |
| :--- | ---: |
| Legislators, administrators and managers | 681 |
| Professionals | 840 |
| Technicians and associate professionals | 651 |
| Clerks | 777 |
| Service and sales workers | 1035 |
| Agriculture and fisheries workers | 640 |
| Trades workers | 664 |
| Plant and machine operators and assemblers | 531 |
| Elementary occupations | 459 |
| Total with listed occupation | 6278 |
| No occupation recorded | 7972 |
| Total | 14250 |

Notes:

1. Occupations are categorised in accordance with the New Zealand Standard Classification of Occupations, 1995 (Statistics NZ).
2. Of the 6278 respondents with an occupation listed, 4515 had full time employment.

Table PE4: Personal income of survey respondents (ages 16 and over)

| Personal income | Respondents |
| :--- | ---: |
| No income | 818 |
| Under $\$ 10,000$ | 1953 |
| $\$ 10,001-\$ 15,000$ | 1572 |
| $\$ 15,001-\$ 17,500$ | 634 |
| $\$ 17,501-\$ 20,000$ | 587 |
| $\$ 20,001-\$ 30,000$ | 1416 |
| $\$ 30,001-\$ 40,000$ | 1267 |
| $\$ 40,001-\$ 50,000$ | 714 |
| $\$ 50,001-\$ 70,000$ | 462 |
| $\$ 70,001-\$ 100,000$ | 187 |
| $\$ 100,000+$ | 106 |
| Don't know/ object to state | 695 |
| Not recorded | 17 |
| Total (age 16 and over) | 10428 |

Table PE5: Local Government Region of residence of survey respondents

| Region of residence | Respondents |
| :--- | ---: |
| Northland | 732 |
| Auckland | 2601 |
| Waikato | 1598 |
| Bay of Plenty | 903 |
| Gisborne | 397 |
| Hawkes Bay | 676 |
| Taranaki | 898 |
| Manawatu/ Wanganui | 896 |
| Wellington | 1288 |
| Nelson/ Marlborough | 694 |
| Canterbury | 1760 |
| West Coast | 389 |
| Otago | 645 |
| Southland | 773 |
| Total | 14250 |

Table PE6: Ethnicity of survey respondents

| Ethnicity | Female | Male | Total |
| :--- | ---: | ---: | ---: |
| NZ Maori | 759 | 718 | 1477 |
| European | 5778 | 5287 | 11065 |
| Pacific | 200 | 156 | 356 |
| Other (including not stated) | 691 | 661 | 1352 |
| Total | 7428 | 6822 | 14250 |

Note: The categories 'European' and 'Pacific' include both immigrants and New Zealand-born people of European or Pacific descent respectively. See Appendix C for further details of ethnicity classification.

Table PE7: Survey respondents by urban/ rural area of residence

| Area of residence | Respondents |
| :--- | ---: |
| Main urban areas | 8511 |
| Secondary urban areas | 1323 |
| Rural areas | 4416 |
| Total | 14250 |

## Comparison with population

The following tables give an indication of the degree of under or over representation of each group within the sample. The figure shown for each group is the ratio of the proportion of the sample accounted for by that group, to the proportion of the population accounted for by the same group. For example, males aged 5-9 made up $5.01 \%$ of the total sample but only $4.08 \%$ of the population. The sample: population ratio for this group is therefore 1.23 , indicating that this group was over-represented in the sample by $23 \%$. Similarly, males aged $20-24$ were underrepresented in the sample by $34 \%$, compared to the total population. The population estimates used were derived from 1996 census data, adjusted to account for demographic changes to December 1997 (the mid-point of the survey) using Statistics NZ estimates of population.

Table PE8: Sample compared to population, for age/ gender groups

| Age | Ratio of sample proportion to <br> population proportion |  |  |
| :--- | :---: | ---: | ---: |
|  | Male | Female | Total |
| $0-4$ | 1.00 | 1.10 | 1.05 |
| $5-9$ | 1.23 | 1.12 | 1.18 |
| $10-14$ | 1.16 | 1.05 | 1.11 |
| $15-19$ | 0.78 | 0.83 | 0.80 |
| $20-24$ | 0.66 | 0.80 | 0.73 |
| $25-29$ | 0.75 | 0.90 | 0.83 |
| $30-39$ | 0.92 | 1.04 | 0.98 |
| $40-49$ | 0.98 | 1.09 | 1.04 |
| $50-64$ | 1.10 | 1.16 | 1.13 |
| $65+$ | 1.05 | 0.99 | 1.01 |
| Total | 1.00 | 1.00 | 1.00 |

Table PE9: Regional age profiles: sample compared to population within region

| Local Government Region | Ratio of sample proportion to regional population proportion |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{r} 0-14 \\ \text { years } \end{array}$ | $15-29$ years | 30-49 <br> years | $\begin{array}{r} 50+ \\ \text { years } \end{array}$ | Total |
| Northland | 1.04 | 0.65 | 0.94 | 1.27 | 1.00 |
| Auckland | 1.16 | 0.77 | 1.05 | 1.01 | 1.00 |
| Waikato | 1.05 | 0.83 | 1.06 | 1.03 | 1.00 |
| Bay of Plenty | 0.96 | 0.91 | 1.12 | 0.98 | 1.00 |
| Gisborne | 1.31 | 0.60 | 0.77 | 1.25 | 1.00 |
| Hawke's Bay | 1.06 | 0.92 | 0.88 | 1.13 | 1.00 |
| Taranaki | 1.03 | 0.99 | 1.00 | 0.97 | 1.00 |
| Manawatu/ Wanganui | 1.23 | 0.67 | 1.03 | 1.05 | 1.00 |
| Wellington | 1.24 | 0.74 | 0.97 | 1.06 | 1.00 |
| Nelson/ Marlborough | 1.11 | 0.77 | 0.97 | 1.11 | 1.00 |
| West Coast | 0.96 | 1.02 | 1.00 | 1.02 | 1.00 |
| Canterbury | 1.04 | 0.88 | 1.05 | 1.01 | 1.00 |
| Otago | 1.00 | 0.62 | 1.01 | 1.34 | 1.00 |
| Southland | 1.07 | 0.94 | 1.02 | 0.96 | 1.00 |
| Total | 1.11 | 0.79 | 1.01 | 1.08 | 1.00 |

During estimation the sample was weighted by age, gender and region to correct for these differences in representation (see Appendix A).

## Driving experience

Survey respondents aged 15 and over were asked to estimate their total driving experience in kilometres. They were asked to describe their experience according to five broad categories: never driven, up to $2000 \mathrm{~km}, 2001-20000 \mathrm{~km}, 20001-200000 \mathrm{~km}$ and over 200000 km . Those who were unable to estimate their lifetime driving experience were recorded as 'Not known'.

This self-reported driving experience is presented in the following graphs. For example, in the $40+$ age group, a higher percentage of women than men have never driven.

Fig PE1: Driving experience by age group and gender
a) Males

b) Females

Fig PE2: Young people's driving experience by single year age group

Note: Results for single year age groups (as in PE2) are more variable than those for five year age groups, due to the smaller sample sizes.

## VEHICLES

## Vehicles

Survey respondents were asked to record details of household vehicles (registered vehicles usually parked at the address overnight, whether private or company owned) and other nonhousehold vehicles used by members of the household.

The numbers of household vehicles in the survey can be scaled up using the appropriate weights to provide national estimates of the number of household vehicles. There is however no comparable estimate for non-household vehicles, as some non-household vehicles may belong to other households and so will already have been counted in the household vehicle total. Nonhousehold vehicles that belong to companies may be available for use by a number of people from different households so some multiple counting of the same vehicle might occur. For these reasons no estimates of national totals can be calculated for non-household vehicles.

Table VE1: Vehicle types

| Vehicle type | Household vehicles |  | Non-household <br> vehicles |
| :--- | ---: | ---: | ---: |
|  | Number in survey | National estimate <br> (thousands) | Number in survey |
| Car/ station wagon | 8005 | 1585.3 | 2268 |
| Van/ ute | 1464 | 263.8 | 604 |
| Truck | 273 | 51.6 | 174 |
| Taxi | 7 | 1.2 | 11 |
| Motorcycle | 316 | 58.0 | 38 |
| Other / unknown | 40 | 9.2 | 144 |
| Total | 10105 | 1969.0 | 3239 |

Note: 'Other' includes buses, tractors, heavy machinery, mobility scooters and other unclassifiable vehicles.

Fig VE1: Household vehicles by type $1989 / 90$ vs 1997/98

Thousand vehicles

Fig VE2: Age profile of household vehicles, 1989/90 vs 1997/98 (cars, vans and utes)

Percentage of vehicle fleet

The estimated mean age of the NZ household vehicle fleet (cars, vans and utes) in 1989/90 was 9.9 years, compared to 10.7 years in 1997/98.

Fig VE3: Engine size profile of household vehicles, 1989/90 vs 1997/98 (cars, vans and utes)

Fig VE4: Engine size of motorcycles (thousands of household vehicles) Thousands

The marked decrease in motorcycle ownership between 1989/90 and 1997/98 was almost entirely the result of a decrease in ownership of smaller motorcycles (under 500 cc ). The estimated mean engine size in 1989/90 was 370 cc, compared to 470 cc in 1997/98.

Table VE2: Household vehicles by age and engine size (National estimates)
a) Cars, vans and utes (thousands)

| Engine size (cc) | Age of vehicle |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & 0-1 \\ & \text { year } \end{aligned}$ | $\begin{gathered} 2-4 \\ \text { years } \end{gathered}$ | $\begin{gathered} 5-9 \\ \text { years } \end{gathered}$ | 10-14 years | $\begin{aligned} & 15-19 \\ & \text { years } \end{aligned}$ | 20 years and over | Total |
| Up to 1000 | 2.0 | 1.1 | 4.4 | 12.1 | 6.7 | 10.9 | 38.3 |

## Crash involved vehicles

The crash data from the LTSA's Traffic Crash Report database can be combined with the estimates of annual vehicle kilometres travelled from the Travel Survey, to derive an exposure adjusted measure of vehicle involvement in crashes.

The number of crash involved vehicles per 100 million km is presented in the tables below for cars, vans and utes of different ages, and for motorcycles. Only vehicles involved in injury crashes reported to the Police were included. These results do not necessarily show that one class of vehicle is more or less safe than any other, as important factors such as driver age and gender, urban/ rural travel split or restraint use are not taken into account here.

Table VE6: Crash involved vehicles per 100 million km travelled Cars, vans and utes, $1989 / 90$ vs 1997/98

| Age | Fatal crashes |  | All reported fatal \& injury <br> crashes |  |
| :--- | ---: | ---: | ---: | ---: |
|  | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ |
| 0-1 year | 2.5 | 1.6 | 52.0 | 28.2 |
| 2-4 years | 1.8 | 1.3 | 48.5 | 25.8 |
| 5-9 years | 2.6 | 1.7 | 61.2 | 35.7 |
| 10-14 years | 4.0 | 1.9 | 90.2 | 47.8 |
| 15-19 years | 7.4 | 3.9 | 147.0 | 73.6 |
| 20 yrs and over | 7.0 | 4.2 | 158.6 | 97.0 |
| Total | 3.9 | 2.2 | 87.2 | 49.2 |

Note: Totals include vehicles of unknown ages.

Table VE7: Crash involved motorcycles per 100 million km 1989/90 vs 1997/98

| Crash type | $1989 / 90$ | $1997 / 98$ |
| :--- | ---: | ---: |
| Fatal crashes | 46.6 | 33.4 |

| Accompanying someone else | 1070 | 6398 | 5325 | 21 | 44 | 8 | 14 | 12880 |
| Total (Note 2) | 22539 | 65543 | 35109 | 2602 | 2499 | 461 | 660 | 129414 |

## Notes

1. The 'other' category includes 254 train trips, 33 ferry trips, 77 plane trips and 296 trips which were classified as 'other' on the survey forms and may include travel by boat, horse, electric wheelchairs etc.
2. Totals include trips for which purpose and/ or trip mode were not recorded.
3. 'Home' includes all trips whose destination was the respondent's home. This may include returning home from work, education, etc.
4. 'Personal business and services' includes trips for medical, dental and social welfare purposes.
5. In this section each leg of an outing is referred to as a trip. For instance, travelling to work may consist of three separate stages, walking to the station, travelling between suburbs by train and then catching a bus to the place of work. This would be included in the table above as three separate trips, each with a different trip mode but with the same overall trip purpose.

Table TR2: Trips by travel mode and overall trip purpose National annual estimates, all ages

| Trip Purpose | Travel mode (million trips: national annual estimates) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Accompanying someone else | 48.0 | 309.3 | 240.9 | Note 5 | 2.0 | Note 5 | Note 5 | 601.9 |
| Total (Note 2) | 1151.1 | 3093.0 | 1618.2 | 111.4 | 134.8 | 27.8 | 33.5 | 6169.8 |

## Notes

1. The 'other' category includes trips by train, ferry, and plane as well as trips which were classified as 'other' on the survey forms. (These may include travel by boat, horse, electric wheelchairs etc).
2. Totals have been calculated before rounding and include 0.67 million trips (national estimate after weighting) for which purpose and/ or trip mode were not recorded.
3. 'Home' includes all trips whose destination was the respondent's home. This may include returning home from work, education, etc.
4. 'Personal business and services' includes trips for social welfare purposes.
5. Estimates could not be made in categories where the number of trips sampled was less than 30.
6. Where the number of trips in the sample was less than 100 (see Table TR1), the accuracy of the estimates will be unreliable.

Table TR3: Distance travelled by travel mode and overall trip purpose National annual estimates, all ages

| Trip <br> Purpose | Travel mode (100 million km travelled: national annual estimates) |  |  |  |  |  |  |

| Shopping | 22.9 | 14.7 | 0.1 | 0.9 | Note 5 | 0.3 | 38.9 |
| Personal business <br> or services (Note 4) | 13.5 | 6.1 | 0.1 | 0.6 | Note 5 | 1.2 | 21.5 |
| Social/ recreational | 53.6 | 58.8 | 0.7 | 3.4 | 0.3 | 1.5 | 118.4 |
| Accompanying <br> someone else | 20.7 | 16.9 | 0.0 | 0.3 | Note 5 | Note 5 | 38.3 |
| Total (Note 2) | 273.2 | 164.6 | 2.9 | 17.9 | 1.5 | 16.1 | 476.1 |

Notes

1. The 'other' category includes trips by train, ferry, and plane as well as trips which were classified as 'other' on the survey forms. (These may include travel by boat, horse, electric wheelchairs etc).
2. Totals have been calculated before rounding and include 0.67 million trips (national estimate after weighting) for which purpose and/ or trip mode were not recorded.
3. 'Home' includes all trips whose destination was the respondent's home. This may include returning home from work, education, etc.
4. 'Personal business and services' includes trips for medical, dental and social welfare purposes.
5. Estimates could not be made in categories where the number of trips sampled was less than 30.
6. Where the number of trips in the sample was less than 100 (see Table TR1), the accuracy of the estimates will be unreliable.
7. Distance was not recorded for walking trips. Distances for 'other' modes are based on respondent estimates. Other distances were calculated from route information given by the respondent.

Table TR4: Number of trips and distance travelled by travel mode

| Travel mode | Trips in survey | National, annual estimates |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Million trips |  | 100 million km |  | km per trip (Note 2) |  |
|  | 1997/98 | 1997/98 | \%change <br> since <br> $1989 / 90$ | 1997/98 | $\begin{aligned} & \text { \%change } \\ & \text { since } \\ & \text { 1989/90 } \end{aligned}$ | 1997/98 | $\begin{aligned} & \text { \%change } \\ & \text { since } \\ & \text { 1989/90 } \end{aligned}$ |
| Vehicle driver | 65543 | 3093.0 | 22\% | 273.2 | 35\% | 8.8 | 10\% |
| Vehicle passenger | 35109 | 1618.2 | 15\% | 164.6 | 14\% | 10.2 | -1\% |
| Walk | 22539 | 1151.1 | 2\% | Note 5 | Note 5 | Note 5 | Note 5 |
| Bicycle | 2602 | 111.4 | -39\% | 2.9 | -19\% | 2.6 | 35\% |
| Bus | 2499 | 134.8 | -11\% | 17.9 | 16\% | 13.7 | 13\% |
| Taxi | 461 | 27.8 | 58\% | 1.5 | 64\% | 5.4 | 6\% |
| Train | 254 | 15.3 | 17\% | 3.3 | -10\% | 21.9 | -21\% |
| Plane (Note 3) | 77 | 3.9 |  | 11.9 |  | 459.4 |  |
| Ferry (Note 3) | 33 | 2.0 |  | 0.3 |  | 19.8 |  |
| Other (Note 4) | 296 | 12.3 | 17\% | 0.6 | -53\% | 5.4 | -58\% |
| Total | 129414 | 6169.8 | 14\% | 476.1 | 24\% | 7.7 | 9\% |

Notes:

1. As travel by children under five was not included in the 1989/90 travel survey, the percentage change figures in the above table are based on travel by ages 5 and over only. (1997/98 estimates includes trips by all ages).
2. Distance per trip has been calculated on trips of known length only. The 'million trips' column shows all trips including those of unknown length.
3. The accuracy of the estimates for plane and ferry travel may be unreliable due to small samples sizes. For the same reason, percentage change comparisons could not be calculated.
4. The 'other' category includes travel by boat, horseback, electric wheelchairs etc.
5. Distance estimates are not available for walking trips.
6. Totals have been calculated before rounding.

Table TR5: Travel mode
a) by age group

| Age group | Travel mode (million trips: national annual estimates) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Walk | Vehicle driver | Vehicle passenger | Bicycle | Bus | Other (Note1) | Total trips (Note 2) |
| 0-4 | 52.3 |  | 322.3 | 0.6 | 1.3 | 1.7 | 378.8 |
| 5-9 | 87.5 |  | 278.2 | 10.4 | 17.4 | 1.7 | 396.8 |
| 10-14 | 111.5 |  | 211.4 | 33.0 | 35.5 | 4.2 | 397.0 |
| 15-19 | 135.9 | 144.2 | 155.9 | 20.8 | 28.4 | 7.8 | 493.1 |
| 20-24 | 110.3 | 262.8 | 108.9 | 18.5 | 9.2 | 10.2 | 519.8 |
| 25-29 | 94.0 | 313.5 | 76.3 | 3.9 | 5.9 | 5.0 | 498.6 |
| 30-34 | 92.6 | 359.9 | 74.8 | 4.5 | 7.0 | 4.4 | 543.2 |
| 35-39 | 86.0 | 456.7 | 62.6 | 3.3 | 7.8 | 5.3 | 621.6 |
| 40-44 | 59.3 | 384.4 | 54.7 | 3.9 | 4.0 | 5.0 | 511.2 |
| 45-49 | 74.1 | 336.4 | 57.8 | 1.5 | 4.4 | 4.7 | 479.0 |
| 50-54 | 58.8 | 247.5 | 43.8 | 2.1 | 3.0 | 2.0 | 357.3 |
| 55-59 | 42.2 | 173.6 | 39.3 | 0.8 | 3.3 | 4.2 | 263.3 |
| 60-64 | 33.0 | 127.4 | 31.6 | 1.6 | 1.7 | 0.9 | 196.2 |
| 65-69 | 39.1 | 105.5 | 31.4 | 3.4 | 2.8 | 0.5 | 182.8 |
| 70-74 | 29.9 | 80.8 | 28.3 | 2.0 | 1.2 | 0.6 | 142.9 |
| 75-79 | 24.0 | 58.6 | 24.2 | 1.0 | 0.3 | 1.9 | 109.9 |
| 80+ | 14.8 | 23.8 | 14.4 | 0.1 | 1.1 | 0.8 | 55.0 |
| Total (Note 2) | 1151.1 | 3093.0 | 1618.2 | 111.4 | 134.8 | 61.3 | 6169.8 |

b) by gender

| Gender | Travel mode |  |  |  |  |  |  |
| :--- | ---: | :---: | :---: | ---: | ---: | ---: | :---: |
|  | (million trips: national annual estimates) |  |  |  |  |  |  |
|  | Walk | Vehicle <br> driver | Vehicle <br> passenger | Bicycle | Bus | Other <br> (Note1) | Total trips <br> (Note 2) |
| Female | 632.5 | 1401.0 | 961.9 | 24.7 | 72.7 | 29.2 | 3122.0 |
| Male | 518.6 | 1691.8 | 656.3 | 86.7 | 62.0 | 32.1 | 3047.7 |
| Total | 1151.1 | 3093.0 | 1618.2 | 111.4 | 134.8 | 61.3 | 6169.8 |

## Notes:

1. The 'Other' category includes travel by train, ferry, taxi and plane as well as boat, horseback, electric wheelchairs etc.
2. Totals have been calculated before rounding and include trips where respondent age or travel mode was unknown.

Fig TR1: Age group profiles: percentage of age group trips by mode

Fig TR2: Trip duration by mode

Fig TR3: Trip distance by mode

Table TR6: People killed or injured in reported injury crashes per 100 million km travelled, by travel mode

| Age group | Driver <br> (light 4 wheeled <br> vehicle) | Passenger <br> (light 4 wheeled <br> vehicle) | Motorcycle <br> rider | Cyclist <br> (Note 1) | Bus <br> passenger |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $0-14$ |  | 11 |  | 291 | 1.1 |
| $15-29$ | 48 | 45 | 973 | 187 | 0.9 |
| $30-44$ | 18 | 17 | 325 | 270 | 1.8 |
| $45-59$ | 15 | 13 | 517 | 283 | 1.2 |
| $60+$ | 26 | 19 | Note 2 | 116 | 1.7 |

Table TR7: People killed or injured in reported injury crashes per million hours of travel, by travel mode

| Age <br> group | Driver <br> (light 4 wheeled <br> vehicle) | Passenger <br> (light 4 wheeled <br> vehicle) | Motorcycle <br> rider | Cyclist <br> (Note 1) | Bus <br> passenger | Pedestrian |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| $0-14$ | 4 |  | 23 | 0.3 | 7 |  |
| $15-29$ | 18 | 18 | 279 | 24 | 0.3 | 4 |
| $30-44$ | 7 | 8 | 104 | 39 | 0.5 | 3 |
| $45-59$ | 5 | 6 | 174 | 33 | 0.4 | 2 |
| $60+$ | 9 | 7 | Note 2 | 13 | 0.5 | 5 |

## Notes to Table TR6 and TR7

1. Cyclists injured in reported motor vehicle crashes only
2. There were insufficient trips to permit calculation of reliable estimates for this age group.
3. These age bands were selected to give adequate sample sizes for all modes of transport in the table. Where sample sizes permit, more detailed age breakdowns are given in the relevant sections of this report (drivers, passengers etc).

Table TR8: Number of trips and distance travelled by vehicle type
a) Drivers

| Vehicle type | Trips in survey |  | National, annual estimates |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Million trips |  | 100 million km |  | km per trip (Note 2) |  |
|  | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 |
| Car or station wagon | 30505 | 52395 | 2089.0 | 2543.4 | 158.3 | 213.0 | 7.6 | 8.4 |
| Van or ute | 3973 | 9965 | 296.8 | 405.5 | 25.4 | 40.3 | 8.6 | 10.0 |
| Truck | 960 | 2144 | 71.9 | 101.1 | 12.6 | 16.4 | 17.5 | 16.3 |
| Motorcycle | 549 | 615 | 40.6 | 27.2 | 2.8 | 1.8 | 6.9 | 6.5 |
| Other (incl. unknown type) | 195 | 253 | 18.1 | 13.6 | 1.5 | 1.6 | 8.5 | 11.8 |
| Total | 36406 | 65539 | 2529.4 | 3093.0 | 201.7 | 273.2 | 8.0 | 8.8 |

b) Passengers aged 5 and over

| Vehicle type | Trips in survey |  | National, annual estimates |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Million trips |  | 100 million km |  | km per trip (Note 2) |  |
|  | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 |
| Car or station wagon | 13717 | 22779 | 951.2 | 1065.1 | 101.5 | 110.1 | 10.7 | 10.3 |
| Van or ute | 1550 | 4595 | 117.9 | 192.9 | 14.4 | 23.2 | 12.3 | 12.0 |
| Truck | 257 | 462 | 34.1 | 22.4 | 3.6 | 3.5 | 10.6 | 15.7 |
| Motorcycle (see Note 3) | 34 | 33 | 3.0 | 1.4 | Note 3 | Note 3 | Note 3 | Note 3 |
| Other (incl. unknown type) | 96 | 306 | 6.8 | 14.2 | 1.0 | 0.4 | 14.8 | 23.5 |
| Total | 15850 | 28175 | 1124.5 | 1295.9 | 121.6 | 139.0 | 10.8 | 10.7 |

c) All passengers, 1997/98 survey

| $*$ <br> Vehicle type | Trips in <br> survey |  |  | National, annual estimates |  |  |
| :--- | ---: | ---: | ---: | ---: | :---: | :---: |
|  |  | Million trips | 100 million <br> km | km per trip <br> (Note 2) |  |  |
| Car or station wagon | 28642 | 1338.2 | 131.8 | 9.9 |  |  |
| Van or ute | 5601 | 238.0 | 26.8 | 11.3 |  |  |
| Truck | 502 | 25.5 | 3.8 | 14.7 |  |  |
| Motorcycle (see Note 3) | 40 | 1.7 | Note 3 | Note 3 |  |  |
| Other (incl. unknown type) | 324 | 14.7 | 2.1 | 14.3 |  |  |
| Total | 35109 | 1618.2 | 164.6 | 10.2 |  |  |

Notes to Table TR8

1. Travel by children under five was not included in the $1989 / 90$ travel survey and is excluded from the 1997/98 figures in table b) above to enable comparison between the two surveys.
2. The 'million trips' column shows all trips including those of unknown length. Distance per trip has been calculated on trips of known length only.
3. The accuracy of the estimates for motorcycle passengers may be unreliable due to small sample sizes.

## Driver trips

Table TR9: Million driver trips annually (all vehicle types) by age group and gender

| Age group | Females |  | Males |  | Total |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ |
| $15-19$ | 39.4 | 68.7 | 70.5 | 75.6 | 109.9 | 144.2 |
| $20-24$ | 89.9 | 129.3 | 180.2 | 133.4 | 270.1 | 262.8 |
| $25-29$ | 117.7 | 142.6 | 170.5 | 170.8 | 288.3 | 313.5 |
| $30-34$ | 164.4 | 170.0 | 189.2 | 189.9 | 353.6 | 359.9 |
| $35-39$ | 146.1 | 233.8 | 186.0 | 222.9 | 332.2 | 456.7 |
| $40-44$ | 144.7 | 194.3 | 153.8 | 190.0 | 298.5 | 384.4 |
| $45-49$ | 102.0 | 135.3 | 154.8 | 201.0 | 256.7 | 336.4 |
| $50-54$ | 62.9 | 96.1 | 107.5 | 151.4 | 170.4 | 247.5 |
| $55-59$ | 47.7 | 61.5 | 88.1 | 112.1 | 135.8 | 173.6 |
| $60-64$ | 42.8 | 55.8 | 93.7 | 71.6 | 136.5 | 127.4 |
| $65-69$ | 19.0 | 36.0 | 66.4 | 69.4 | 85.4 | 105.5 |
| $70-74$ | 17.8 | 35.8 | 30.6 | 45.0 | 48.4 | 80.8 |
| $75-79$ | 12.8 | 22.7 | 13.9 | 35.9 | 26.7 | 58.6 |
| $80+$ | 3.7 | 9.3 | 10.3 | 14.5 | 14.0 | 23.8 |
| Total | 1012.8 | 1401.0 | 1516.6 | 1691.8 | 2529.4 | 3093.0 |

Note: Totals include estimates based on travel by respondents of unknown age

Table TR10: Distance driven by age group and gender for drivers of all vehicle types (national annual estimates, 100 million km)

| Age group | Females |  | Males |  | Total |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ |
| $15-19$ | 2.5 | 4.4 | 4.8 | 5.7 | 7.3 | 10.1 |
| $20-24$ | 6.6 | 11.2 | 17.1 | 13.4 | 23.7 | 24.5 |
| $25-29$ | 7.4 | 11.0 | 18.8 | 19.9 | 26.2 | 30.9 |
| $30-34$ | 9.8 | 11.4 | 19.6 | 20.1 | 29.4 | 31.5 |
| $35-39$ | 8.1 | 16.5 | 18.9 | 24.6 | 27 | 41.1 |
| $40-44$ | 8.8 | 12.7 | 15.4 | 21.8 | 24.2 | 34.4 |
| $45-49$ | 6.1 | 10.3 | 12.2 | 21.2 | 18.3 | 31.4 |
| $50-54$ | 3.7 | 6.7 | 10.7 | 16.1 | 14.4 | 22.7 |
| $55-59$ | 2.5 | 4.8 | 6.6 | 10.2 | 9.1 | 15 |
| $60-64$ | 2.1 | 3.3 | 9.5 | 7.3 | 11.6 | 10.6 |
| $65-69$ | 1.1 | 2.8 | 3.9 | 6.1 | 5.0 | 8.9 |
| $70-74$ | 0.7 | 2.2 | 3.0 | 3.3 | 3.7 | 5.5 |
| $75-79$ | 0.5 | 0.8 | 0.6 | 2.5 | 1.1 | 3.3 |
| $80+$ | 0.2 | 0.3 | 0.4 | 0.8 | 0.6 | 1.1 |
| Total | 60.2 | 99.2 | 141.5 | 174.0 | 201.7 | 273.2 |

Note: Totals include estimates based on travel by respondents of unknown age and/or gender.

## Drivers of cars, vans and utes

Table TR11: Drivers of cars, vans and utes; estimates of number of trips, distance driven and distance per trip by age group and gender (1997/98).

| Age group |  | Females |  | km per trip (Note 1) | Trips in survey | Males |  | km per trip (Note 1) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Trips in survey | Million trips | $\begin{array}{\|c\|} 100 \text { million } \\ \mathrm{km} \end{array}$ |  |  | Million trips | $\begin{aligned} & 100 \text { million } \\ & \text { km } \end{aligned}$ |  |
| 15-19 | 1183 | 68.2 | 4.4 | 6.5 | 1262 | 70.3 | 5.4 | 7.6 |
| 20-24 | 2267 | 127.6 | 11.0 | 8.6 | 1970 | 120.4 | 11.9 | 9.9 |
| 25-29 | 2908 | 140.7 | 10.8 | 7.7 | 2673 | 156.4 | 17.3 | 11.1 |
| 30-34 | 3661 | 168.1 | 11.3 | 6.7 | 3535 | 182.2 | 17.9 | 9.8 |
| 35-39 | 5095 | 228.2 | 16.0 | 7.0 | 4180 | 197.9 | 21.4 | 10.8 |
| 40-44 | 4152 | 192.5 | 12.6 | 6.5 | 3881 | 179.3 | 19.3 | 10.8 |
| 45-49 | 3247 | 134.2 | 10.2 | 7.6 | 3772 | 189.3 | 19.2 | 10.1 |
| 50-54 | 2316 | 95.6 | 6.6 | 6.9 | 3095 | 133.4 | 13.3 | 10.0 |
| 55-59 | 1649 | 61.1 | 4.8 | 7.8 | 2470 | 103.7 | 9.5 | 9.2 |
| 60-64 | 1209 | 52.7 | 3.1 | 5.9 | 1718 | 67.3 | 7.0 | 10.4 |
| 65-69 | 875 | 36.0 | 2.8 | 7.7 | 1559 | 66.8 | 6.0 | 8.9 |
| 70-74 | 733 | 35.8 | 2.2 | 6.3 | 982 | 42.1 | 3.1 | 7.4 |
| 75-79 | 446 | 22.7 | 0.8 | 3.5 | 687 | 35.7 | 2.5 | 6.9 |
| 80+ | 184 | 9.3 | 0.3 | 3.6 | 347 | 14.5 | 0.8 | 5.5 |
| Total (Note 2) | 30115 | 1382.4 | 97.7 | 7.1 | 32245 | 1566.5 | 155.6 | 10.0 |

## Notes

1. The 'million trips' column shows all trips including those of unknown length. Distance per trip has been calculated on trips of known length only.
2. The total rows include trips for which driver age was not recorded.

Fig TR4: Annual distance driven in light 4-wheeled vehicles National estimates ( 100 million km)

2. The data have been smoothed with a three-hour moving average.

Passengers
Table TR15: Distance travelled by passengers in cars, vans and utes (National annual estimates)

| Age group | Distance travelled (100 million passenger km) |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | Females |  | Males |  | Total (Note 1) |  |
|  | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ |
| $0-4$ | Note 2 | 12.4 | Note 2 | 13.0 | Note 2 | 25.4 |
| $5-9$ | 8.2 | 9.9 | 8.0 | 10.8 | 16.2 | 20.7 |
| $10-14$ | 6.0 | 7.9 | 8.9 | 9.4 | 14.9 | 17.3 |
| $15-19$ | 7.9 | 7.8 | 9.3 | 6.9 | 17.2 | 14.7 |
| $20-24$ | 10.1 | 8.4 | 5.4 | 4.9 | 15.5 | 13.3 |
| $25-29$ | 5.7 | 5.8 | 2.8 | 2.7 | 8.4 | 8.5 |
| $30-34$ | 5.8 | 5.8 | 3.2 | 2.4 | 9.0 | 8.2 |
| $35-39$ | 5.0 | 5.0 | 1.0 | 2.3 | 6.1 | 7.3 |
| $40-44$ | 3.8 | 6.2 | 1.7 | 2.9 | 5.5 | 9.1 |
| $45-49$ | 3.4 | 6.5 | 1.1 | 1.9 | 4.5 | 8.4 |
| $50-54$ | 2.7 | 3.8 | 0.8 | 1.0 | 3.5 | 4.8 |
| $55-59$ | 3.7 | 4.6 | 0.9 | 1.4 | 4.6 | 6.0 |
| $60-64$ | 3.7 | 3.0 | 0.7 | 0.9 | 4.4 | 3.9 |
| $65-69$ | 2.0 | 3.5 | 0.7 | 0.9 | 2.7 | 4.4 |
| $70-74$ | 1.8 | 2.0 | 0.1 | 1.2 | 1.9 | 3.2 |
| $75-79$ | 0.7 | 1.8 | 0.1 | 0.3 | 0.8 | 2.1 |
| Total (ages 5+) | 70.9 | 82.8 | 45.0 | 50.4 | 116.0 | 133.3 |
| Total (all ages) |  | 95.2 |  | 63.5 |  | 158.6 |

Notes

1. Totals include estimates based on travel by respondents of unknown age.
2. Children under 5 were not included in the 1989/90 travel survey.

Table TR16: Passenger trips in cars, vans and utes, distance travelled and distance per trip by age and gender

| Age group | Females |  |  |  | Males |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Trips in survey | National annual estimates |  |  | Trips in survey | National annual estimates |  |  |
|  |  | Million trips | 100 million km | km per trip |  | Million trips | $\begin{gathered} 100 \\ \text { million km } \end{gathered}$ | km per trip |
| 0-4 | 3455 | 157.6 | 12.4 | 7.8 | 3414 | 160.7 | 13.0 | 8.1 |

| $15-19$ | 458 | 28.4 | 392.7 | 49 | 3.6 | 12.2 |
| $20-29$ | 219 | 15.0 | 193.2 | 131 | 8.5 | 45.2 |
| $30-39$ | 209 | 14.8 | 164.1 | 88 | 5.1 | 29.0 |
| $40-49$ | 154 | 8.4 | 123.1 | 57 | 3.7 | 37.5 |
| $50-59$ | 124 | 6.3 | 102.8 | 42 | 2.0 | 13.2 |
| $60-69$ | 87 | 4.5 | 87.4 | 12 | 0.4 | 1.9 |
| $70+$ | 63 | 2.6 | 30.2 | 31 | 1.8 | 5.5 |
| Total | 2499 | 134.8 | 1790.8 | 461 | 27.8 | 149.4 |

Table TR18: Passenger trips (ages 5 and over)

|  | Million trips |  | Million km |  |
| :--- | ---: | ---: | ---: | ---: |
|  | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ |
| Cars, vans and utes | 1069 | 1258 | 11595 | 13320 |
| Buses | 125 | 133 | 1529 | 1772 |
| Taxis | 17 | 27 | 87 | 147 |

Note: Children under 5 were not included in the 1989/90 Travel Survey

## Cyclists

All cycle trips referred to in this chapter took place on public roads. Off road cycling was not included in the Travel Survey.

Table TR19: Cycle trips, hours spent cycling, distance ridden and distance per trip by age group and survey year

| Age group | Trips in survey |  | National, annual estimates |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Million trips |  | Million hours |  | Million km |  | km per trip |  |
|  | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 |
| 5-9 | 286 | 290 | 22.5 | 10.4 | 3.4 | 1.8 | 16.8 | 14.1 | 0.7 | 1.4 |
| 10-14 | 936 | 959 | 60.6 | 33.0 | 13.4 | 7.9 | 101.0 | 63.3 | 1.7 | 1.9 |
| 15-19 | 674 | 468 | 41.9 | 20.8 | 8.5 | 5.1 | 82.7 | 54.9 | 2.0 | 2.7 |
| 20-24 | 216 | 199 | 14.5 | 18.5 | 2.6 | 3.3 | 32.8 | 50.4 | 2.3 | 2.7 |
| 25-29 | 147 | 94 | 8.9 | 3.9 | 2.9 | 1.4 | 32.3 | 19.1 | 3.6 | 4.9 |
| 30-34 | 112 | 97 | 9.7 | 4.5 | 2.6 | 1.3 | 27.5 | 22.6 | 2.8 | 5.0 |
| 35-39 | 92 | 97 | 6.8 | 3.3 | 1.7 | 0.8 | 18.9 | 10.3 | 2.8 | 3.1 |
| 40+ | 245 | 383 | 16.5 | 16.4 | 4.1 | 4.3 | 39.5 | 49.5 | 2.4 | 3.0 |
| Total (ages 5+) | 2708 | 2587 | 181.5 | 110.8 | 39.2 | 26.0 | 351.6 | 284.2 | 1.9 | 2.6 |

Notes

1. Children under 5 were not included in the 1989/90 travel survey. In the 1997/98 survey, there were too few trips by children under 5 to enable calculation of reliable estimates for this age group.
2. Totals were calculated before rounding and may include trips by cyclists of unknown age.
3. Distance per trip has been calculated on trips of known length only.

Table TR20: Cycle trips, distance ridden and distance per trip by age group and gender

| Age group | Females |  |  |  | Males |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Trips in survey | National annual estimates |  |  | Trips in survey | National annual estimates |  |  |
|  |  | Million trips | Million km | km per trip |  | Million trips | Million km | km per trip |
| 5-9 | 82 | 2.8 | 4.0 | 1.4 | 208 | 7.5 | 10.2 | 1.4 |
| 10-14 | 289 | 9.8 | 20.8 | 2.1 | 670 | 23.2 | 42.5 | 1.8 |
| 15-19 | 112 | 3.5 | 9.4 | 2.7 | 356 | 17.3 | 45.5 | 2.6 |
| 20-39 | 110 | 4.9 | 16.8 | 3.4 | 377 | 25.4 | 85.6 | 3.4 |
| 40+ | 100 | 3.2 | 8.3 | 2.6 | 283 | 13.2 | 41.2 | 3.1 |
| Total (ages 5+) | 693 | 24.2 | 59.2 | 2.5 | 1894 | 86.6 | 225.0 | 2.6 |

## Notes

1. There were too few trips by children aged under 5 to enable calculation of reliable estimates for this age group.
2. Totals include trips by cyclists whose age was not recorded.
3. Distance per trip has been calculated on trips of known length only.

Fig TR29: Total annual distance cycled (million km) by age and gender

Fig TR30: Total annual distance cycled (million km) 1989/90 vs 1997/8

Million km

Fig TR31: Total annual hours spent cycling (million hours) 1989/90 vs 1997/98

Million hours

## Cyclists killed and injured in crashes involving motor vehicles

The graphs below show cyclists killed and injured in crashes involving motor vehicles. Cyclistonly and cyclist-pedestrian crashes are not reported to the LTSA and hence are not included in these figures. For estimates of cyclist risk in crashes not involving a motor vehicle (eg cyclistonly or cyclist-pedestrian crashes), see the following section.

Fig TR32: Cyclists killed and injured in crashes involving motor vehicles (annual average 1997/98)

Fig TR33: Cyclists killed and injured in crashes involving motor vehicles per 100 million km travelled

Casualties/ $\mathbf{1 0 0}$ million km

Notes

1. There were too few female cyclists to enable calculation of separate estimates for males and females.
2. Children under 5 were not included in the 1989/90 Travel Survey

Fig TR34: Cyclists killed and injured in crashes involving motor vehicles per million hours spent cycling

Table TR21: Cyclists killed and injured, distance cycled and estimated risk 1989/90 vs 1997/98

|  | 1989/90 | 1997/98 |
| :--- | :---: | :---: |
| Cyclists killed and injured in crashes <br> involving motor vehicles (annual average) | 1074 | 687 |
| Million km cycled (on-road) | 351.6 | 284.2 |
| Million hours spent cycling (on-road) | 39.2 | 26.0 |
| Cyclists killed and injured per 100 million <br> km cycled | 306 | 242 |
| Cyclists killed and injured per million <br> hours spent cycling | 27.4 | 26.4 |

Note: To enable comparison with the 1989/90 survey, travel by children under five is excluded from the 1997/98 figures in this table.

Fig TR35: Distance ridden by hour of day Million km cycled

Fig TR36: Cyclists killed and injured in crashes involving motor vehicles, by hour of day
Cyclists killed and injured

Fig TR37: Cyclists killed and injured in crashes involving motor vehicles per 100 million $\mathbf{k m}$ ridden, by hour of day
Cyclists injured/ 100 million km

## Cyclists injured in crashes not involving a motor vehicle

A measure of injury in crashes where a motor vehicle was not involved (such as cyclist-only or cyclist-pedestrian accidents), can be derived from hospitalisation data supplied by the New Zealand Health Information Service. This dataset includes cyclists admitted overnight as a result of crashes. It excludes those who died before admission to hospital, and minor injuries requiring outpatient treatment only.

Fig TR38: Cyclist admissions to hospital per 100 million $\mathbf{k m}$ ridden (as a result of non motor vehicle crashes on a public road)

Note: The above includes only crashes identified as occurring on a public road. Location was not recorded for a large number of crashes, and it is to be expected that many of these also occurred on public roads.

Pedestrians
Table TR22: Pedestrian trips, time spent walking and road crossings by age group

| Age group | Trips in survey |  | National, annual estimates |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Million trips |  | Million hours |  | Million roads crossed |  |
|  | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 | 1989/90 | 1997/98 |
| 0-4 | See note | 1122 | See note | 52.3 | See note | 10.3 | See note | 101.2 |
| 5-9 | 1475 | 2168 | 97.4 | 87.5 | 16.2 | 14.7 | 153.9 | 145.2 |
| 10-14 | 1857 | 2418 | 127.7 | 111.5 | 24.2 | 22.1 | 278.0 | 244.8 |
| 15-19 | 1898 | 2226 | 146.9 | 135.9 | 29.1 | 28.7 | 325.2 | 306.2 |

| 45-49 | 781 | 1363 | 56.9 | 74.1 | 8.9 | 11.2 | 90.5 | 140.1 |
| 50-54 | 644 | 1252 | 42.5 | 58.8 | 7.1 | 9.7 | 72.5 | 110.5 |
| 55-59 | 587 | 1011 | 41.4 | 42.2 | 6.3 | 7.3 | 61.0 | 82.7 |
| 60-64 | 663 | 767 | 59.2 | 33.0 | 12.4 | 6.5 | 96.5 | 63.3 |
| 65-69 | 528 | 823 | 37.0 | 39.1 | 6.7 | 7.8 | 57.7 | 87.6 |
| 70-74 | 385 | 631 | 28.5 | 29.9 | 5.3 | 5.9 | 49.2 | 54.1 |
| 75-79 | 370 | 467 | 26.9 | 24.0 | 5.6 | 4.3 | 39.2 | 37.1 |
| 80+ | 174 | 302 | 10.9 | 14.8 | 2.5 | 3.2 | 21.5 | 30.4 |
| Total (ages 5+) | 15474 | 21417 | 1079.7 | 1098.8 | 191.7 | 204.4 | 2044.6 | 2314.8 |
| Total (all ages) |  | 22539 |  | 1151.1 |  | 214.7 |  | 2416.0 |

Notes
1: Travel by children under five was not included in the 1989/90 travel survey.
2: Totals include travel by pedestrians of unknown age.

Table TR23: Pedestrian trips, time spent walking and number of road crossings, by age group and gender

| Age group | Females |  |  |  | Males |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Trips in survey | National annual estimates |  |  | Trips in survey | National annual estimates |  |  |
|  |  | Million trips | Million hours | Million road crossings |  | Million trips | Million hours |  |
| 0-4 | 539 | 24.5 | 4.3 | 46.8 | 583 | 27.8 | 6.0 | 54.4 |
| 5-9 | 1015 | 40.7 | 7.0 | 68.0 | 1153 | 46.9 | 7.6 | 77.2 |
| 10-14 | 1225 | 57.7 | 11.2 | 116.8 | 1193 | 53.8 | 11.0 | 128.0 |
| 15-19 | 1161 | 70.4 | 16.5 | 154.3 | 1065 | 65.6 | 12.2 | 151.9 |
| 20-24 | 1039 | 64.2 | 10.8 | 132.3 | 621 | 46.1 | 9.5 | 132.9 |
| 25-29 | 960 | 52.2 | 11.3 | 122.9 | 599 | 41.8 | 8.3 | 104.4 |

Fig TR47: Pedestrians injured in reported injury motor vehicle crashes by time of day (annual average 1997/98)

Note: "Children" refers to people aged 17 and under; "Adults" to those 18 or more.

Fig TR48: Pedestrians injured in reported motor vehicle injury crashes per million hours spent walking, by time of day (0600-2259)

Pedestrians injured/million hours

Notes:

1. "Children" refers to people aged 17 and under; "Adults" to those 18 or more.
2. Values were not calculated for children in the hours beginning 0600, 2000, 2100 and 2200 as the numbers of trips and/ or casualties were too small to give reliable estimates.

## Urban and rural residents

This section compares the travel patterns of urban residents (people living in Main or Secondary Urban areas, that is, towns or cities with populations of at least 10,000 ) with residents of smaller towns and rural areas (called 'rural residents' here).

Table UR1: Million trips per year by mode and area of residence type

| Frequency | Urban | Rural | Total |
| :--- | ---: | ---: | ---: |
| Walk | 972.4 | 178.6 | 1151.1 |
| Vehicle driver | 2423.2 | 669.7 | 3093.0 |
| Vehicle passenger | 1252.1 | 366.0 | 1618.2 |
| Bicycle | 92.1 | 19.3 | 111.4 |
| Train | 14.7 | 0.6 | 15.3 |
| Bus | 96.1 | 38.7 | 134.8 |
| Ferry | 1.7 | 0.3 | 2.0 |
| Plane | 3.2 | 0.6 | 3.9 |
| Taxi | 26.9 | 0.9 | 27.8 |
| Other | 5.7 | 6.6 | 12.3 |
| Total | 4888.3 | 1281.5 | 6169.8 |

Note: totals include trips with unknown mode.

Table UR2: Percentage of trips by trip purpose

| Trip Purpose | Urban | Rural | Total |
| :--- | ---: | ---: | ---: |
| Home | $30 \%$ | $31 \%$ | $30 \%$ |
| Work - main job | $9 \%$ | $9 \%$ | $9 \%$ |
| Work - other job | $0 \%$ | $1 \%$ | $0 \%$ |
| Work - on employer's business | $5 \%$ | $4 \%$ | $4 \%$ |
| Education | $4 \%$ | $4 \%$ | $4 \%$ |
| Shopping | $11 \%$ | $12 \%$ | $11 \%$ |
| Personal business/ services | $5 \%$ | $6 \%$ | $5 \%$ |

Fig UR2: Hours spent travelling per person per week, by major modes (Residents of urban and rural areas)
hours per person

## Local Government Regions

The region of residence of each respondent was recorded with their travel. Estimates in this section are based on travel by residents of the specified region. This may differ from travel actually occurring in a particular region.

Table RE1: Trips in sample by region and mode

| Region | Driver (cars, vans and utes) | Passenger (cars, vans and utes) | Cyclist | Pedestrian | Bus |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Northland | 2756 | 1630 | 50 | 764 | 151 |
| Auckland | 11282 | 6182 | 181 | 4314 | 515 |

| National average | 10.2 | 4.3 | 83 |

## Notes:

1. Driver and passenger distances apply to drivers and passengers in cars, vans and utes only.
2. A driver is defined as any person who reported driving at least 20 km in the year preceding the survey.

Fig RE3: Annual km driven per driver (cars, vans and utes)

Fig RE4: Annual km per person travelled as a passenger (cars, vans and utes)

Fig RE5: Annual km cycled, per person aged 5 and over

## Ethnicity

In the personal interviews, respondents were asked to indicate which ethnic group best described them. This section compares travel patterns for three major ethnic groups in New Zealand, those of European descent, Maori people and people of Pacific descent. The European and Pacific groups include both people born in New Zealand and immigrants.

There are several differences between these ethnic groups, including the age structure (the proportion of younger people compared to older people) and the proportion that live in towns and rural areas compared to cities. Travel patterns reflect these as well as cultural and socioeconomic differences.

Fig ET1: Average daily distance travelled per person, by age group, ethnicity and mode (excludes walking)

Fig ET2: Average daily time per person spent travelling by age group, ethnicity and mode

Note: 'Other' includes travel by train, ferry, plane, taxi and by boat, electric wheelchair etc.

## Table ET1: Reason for trip

a) Children and youth (aged 17 and under)

| Reason for trip | National, annual estimates |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | Million trips |  |  | Percentage of trips |  |  |
|  | Maori | European | Pacific | Maori | European | Pacific |
| Home (Note 1) | 56.6 | 320.9 | 13.6 | $33 \%$ | $32 \%$ | $31 \%$ |
| Work - main job | 1.4 | 10.0 | 0.2 | $1 \%$ | $1 \%$ | $1 \%$ |
| Work - other job | 0.2 | 1.1 | 0.5 | $0 \%$ | $0 \%$ | $1 \%$ |
| Work - employer's business | 0.8 | 4.3 | 0.8 | $0 \%$ | $0 \%$ | $2 \%$ |
| Education | 20.2 | 114.0 | 5.2 | $12 \%$ | $11 \%$ | $12 \%$ |
| Shopping | 14.6 | 66.5 | 2.5 | $8 \%$ | $7 \%$ | $6 \%$ |
| Personal business or | 2.9 | 16.5 | 2.9 | $2 \%$ | $2 \%$ | $7 \%$ |
| services (Note 2) | 0.6 | 5.3 | 0.1 | $0 \%$ | $1 \%$ | $0 \%$ |
| Medical/ dental | 40.7 | 246.2 | 9.1 | $23 \%$ | $24 \%$ | $21 \%$ |
| Social/ recreational | 14.2 | 71.4 | 2.0 | $8 \%$ | $7 \%$ | $5 \%$ |
| Change to another mode | 21.9 | 153.8 | 6.8 | $13 \%$ | $15 \%$ | $16 \%$ |
| Accompanying someone else | 174.1 | 1010.2 | 43.6 | $100 \%$ | $100 \%$ | $100 \%$ |
| Total (Note 3) |  |  |  |  |  |  |

## b) Adults (aged 18 and over)

| Reason for trip | National, annual estimates |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | Million trips |  |  | Percentage of trips |  |  |
|  | Maori | European | Pacific | Maori | European | Pacific |
| Home (Note 1) | 102.0 | 1145.9 | 49.1 | $31 \%$ | $30 \%$ | $31 \%$ |
| Work - main job | 35.5 | 455.3 | 15.7 | $11 \%$ | $12 \%$ | $10 \%$ |
| Work - other job | 2.0 | 21.1 | 0.9 | $1 \%$ | $1 \%$ | $1 \%$ |
| Work - employer's business | 18.1 | 230.4 | 5.4 | $5 \%$ | $6 \%$ | $3 \%$ |
| Education | 3.6 | 36.3 | 2.1 | $1 \%$ | $1 \%$ | $1 \%$ |
| Shopping | 38.1 | 503.8 | 16.4 | $12 \%$ | $13 \%$ | $10 \%$ |
| Personal business or <br> services (Note 2) | 17.9 | 215.0 | 8.5 | $5 \%$ | $6 \%$ | $5 \%$ |
| Medical/ dental | 2.2 | 33.4 | 1.6 | $1 \%$ | $1 \%$ | $1 \%$ |
| Social/ recreational | 63.2 | 693.7 | 28.9 | $19 \%$ | $18 \%$ | $18 \%$ |
| Change to another mode | 16.3 | 227.1 | 15.7 | $5 \%$ | $6 \%$ | $10 \%$ |
| Accompanying someone else | 29.8 | 291.6 | 16.6 | $9 \%$ | $8 \%$ | $10 \%$ |
| Total (Note 3) | 328.9 | 3853.7 | 160.8 | $100 \%$ | $100 \%$ | $100 \%$ |

1. 'Home' includes all trips whose destination was the respondent's home. This may include returning home from work, education, etc.
2. 'Personal business and services' includes trips for social welfare purposes.
3. Totals include trips for which purpose was not recorded.
4. Trips by people whose age was not recorded are excluded from these tables ( $0.03 \%$ of trips).

Table ET2: Proportion of adults who are current drivers

| Ethnicity | \% adults who are current drivers (see note) |  |
| :--- | ---: | ---: |
|  | Male |  |
| Maori | $84 \%$ | Female |
| European | $92 \%$ | $64 \%$ |
| Pacific | $72 \%$ | $85 \%$ |

Note: 'Current drivers' are people aged 15 and over who reported driving at least 20 km in the twelve months preceding the survey.

## Hospitalisations

Ethnicity of crash victims is not recorded on Traffic Crash Reports completed by Police. However, hospital admission statistics held by the New Zealand Health Information Service record the ethnicity of casualties who are injured seriously enough to be admitted to hospital. These can be used to calculate the risk of being hospitalised as a result of a crash, per unit of exposure (kilometre travelled, or hour spent walking). (Note that these are not the same as the risk measures used elsewhere in the Travel Survey, as fatalities and minor injuries are not included).

Table ET3: Drivers and passengers hospitalised per 100 million km travelled 1997/98 (all ages combined)

| Ethnicity | Drivers | Passengers |
| :--- | ---: | ---: |
|  | Hospital admissions per 100 million <br> km travelled |  |
|  | 20.5 | 26.0 |
| European | 6.1 | 6.8 |
| Pacific | 17.6 | 21.9 |

Table ET4: Pedestrians hospitalised per million hours spent walking 1997/98 (all ages combined)

| Ethnicity | Hospital admissions per million <br> hours spent walking |
| :--- | :---: |
| Maori | 5.4 |
| European | 2.3 |
| Pacific | 5.6 |

Fig ET3: Risk of hospitalisation, by age group and ethnicity a) Drivers: hospital admissions per 100 million $\mathbf{k m}$ driven

b) Passengers: hospital admissions per 100 million km driven

c) Pedestrians: hospital admissions per million hours spent walking

## ALCOHOL

## Alcohol consumption by drivers

Self-reporting: Respondents who drove at all on the survey days were also asked to record the times, amounts and types of alcohol they drank during the survey period. Drinking session information was recorded in both the 1989/90 and 1997/98 surveys, but the type and amount of alcohol are available for the 1997/98 survey only.

Table AL1: Drinking session by venue

| Venue | Sessions in the <br> survey |  | Sstimated national daily average <br> (thousands) |  |  |  |  | Sours <br> (thousands) |  | Average hours <br> per session |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: |
|  | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ | $1989 / 90$ | $1997 / 98$ |  |  |  |

Fig AL7: Percentage of driver trips made within one hour after a drinking session

Table AL7: Alcohol-impaired trips per ten thousand driver trips

| Time of day and week | Alcohol impaired trips <br> per ten thousand driver trips |  |
| :--- | :---: | :---: |
|  | Males | Females |
| Trips at all times | 46 | 7 |
| Trips during high alcohol hours | 288 | 89 |

Notes:

1. "High alcohol hours" are defined as the hours between 10 pm and 4 am daily, plus $4 \mathrm{am}-6 \mathrm{am}$ on Fridays, Saturdays and Sundays. These hours are used by the Land Transport Safety Authority to represent times when the highest proportions of crashes involving alcohol occur.
2. Drivers were assumed to be alcohol impaired during a particular driving trip, if they drove following a drinking session during which enough alcohol was consumed to place the average person at risk of being over the legal blood alcohol limit. Normal rates of absorption and elimination of alcohol from the blood and the time lag between the drinking session and the driving trip were taken into account.
3. Further breakdown (eg into age groups) is not possible due to the relatively small number of drivers in the survey who had exceeded safe drink-driving guidelines ( $\mathrm{N}=108$ drivers).

## APPENDICES

## Appendix A: Estimation formulas and weights

## Estimation of means and totals

The mean of a variable $x$ for a particular domain (or subgroup) of the population, d , can be estimated from this same domain in the sample, $\mathrm{S}_{\mathrm{d}}$, by using the weighted mean (Särndel et al, 1992, p185) of all sample members, $i j$ : (denoting the person selected in household $j$ in meshblock $i$ ) who belong to domain d .
$\tilde{\mathrm{x}}_{\mathrm{S}_{\mathrm{d}}}=\frac{\sum_{\mathrm{ij} \in \mathrm{S}_{\mathrm{d}}} \mathrm{x}_{\mathrm{ij}} \text { weight }_{\mathrm{ij}}}{\sum_{\mathrm{ij} \in \mathrm{S}_{\mathrm{d}}} \text { weight }_{\mathrm{ij}}}$
where weight $_{i j}$ is the multiple of the sampling weights for each stage of sampling:

$$
\text { weight }_{i j}=\frac{1}{p r\{\mathrm{mb} \text { sampled }\}_{\mathrm{i}}} \times \frac{1}{s f_{i}}
$$

where
$\operatorname{pr}\{\mathrm{mb}$ sampled $\}$ is the probability that the meshblock was sampled, which is proportional to the 1991 Census population of the meshblock in most cases (see above for details)
and
$s f_{i}=\frac{1}{7}$ or $\frac{1}{8}$, depending on the sampling interval used to sample households.

## Non-response weights

## Household

A number of sampled households did not supply any data for the survey: either no-one was at home whenever an interviewer called or the household refused to give any information. Such households are referred to as non-responding households. To use zeros for these households would lead to an underestimate of actual travel. Therefore available household information was used to impute a response for these non-responding households. Any given non-responding household was matched to a group of responding households by Local Government Region ${ }^{4}$ and urban/rural location of households within Region. These groups are referred to as household non-response groups. For Auckland, there was a further grouping by the four urban areas: North Auckland, West Auckland, South Auckland and Central Auckland. As area and urbanisation are related to travel behaviour, a good imputed response for any non-responding household is the average response of all the responding households in the group to which it belongs.

The household non-response weighting procedure adjusts the weights of the responding households so that their responses can partially represent those of matched non-responding households ("partially", since the average response of several households is always used for imputation).

[^2]
## Person post-stratification weights

Within sampled households, there are sometimes people who are difficult to contact or who refuse to supply any travel data, while other members of their household do supply information about the household and basic information about the non-responding members. Such households are described as partially-responding. For non-responding members of such households, there is more information on which to impute responses, some of which is related to travel behaviour. All responding eligible people were grouped by Region, age groups and gender and then multiplied by a factor that aligned the weighted sample (viz. estimated population numbers) to estimated population data for December 1997 (mid-way through the survey) by the same Region, age group and gender classifications. For the household and person post stratification weights, the area, age and gender categories were chosen so that an adequate number of sample members were always used for imputation.

Trip non-response and post-stratification weights
The last stage of non-response weighting involved firstly using Regional trip data to represent people with missing trip data (but with other information provided) and secondly, post-stratifying the weighted trip data so that there was an even distribution of weighted trips by day of week. This last step was necessary as there is a strong day of week pattern to many trip modes. As there was little evidence of seasonal variation in travel and the sample was already quite well distributed over the full survey year (apart from some Auckland households ${ }^{5}$ ), there was no attempt to weight trip data to achieve an equal distribution of the sample by time of year.

## The estimation of sampling errors

Sampling errors were calculated using a method due to Mahalanobis (1946), described by Wolter (1985). The sample at the meshblock level was randomly divided into $n=5$ groups, each of whose structure matched that of the parent sample. For each group, $i$, and estimate $\hat{M}$ of the population mean or total (calculated from the entire sample as described above), an estimate, $\hat{M}_{i}$ was calculated from the members of group $i$, using the weights and estimators as described above and the same non-response imputation and post-stratification procedures. The variance, $v(\hat{M})$ of the estimates was estimated from these values:
$v(\hat{M})=\frac{\sum_{i=1}^{n}\left(\hat{M}_{i}-\bar{M}\right)^{2}}{n \times(n-1)}$ where $\bar{M}$ is the mean of the $\hat{M}_{i}$
The variance estimates themselves were quite variable, particularly for estimates from relatively small subgroups. As there was also a marked positive skew to the distribution of variance estimates, the above procedure was repeated for 10 independent random groupings (each with 5 random groups) and the median of these 10 variances was taken as the best variance estimate. Such a procedure generates a variance estimate with 49 degrees of freedom.

A $(1-\alpha) \times 100$ percent confidence interval for $M$ (the population mean or total) is:
$\left.\left(\hat{M}-t_{49, \alpha / 2} \sqrt{\operatorname{median}(v(\hat{M})}\right), \hat{M}+t_{49, \alpha / 2} \sqrt{\operatorname{median}(v(\hat{M}))}\right)$

[^3]
## Appendix B: Sampling errors for travel estimates

## Introduction

The following section has sampling errors for the main travel estimates generated from the survey data. The sampling errors are computed according to the description in Appendix A. The column headed " $95 \%$ confidence intervals" gives the half-width of the $95 \%$ confidence interval for the parameter being estimated. The centre of this confidence interval is the estimate itself and it can be assumed that there is a $95 \%$ chance that the real population value (which is being estimated) will be somewhere within this interval. Where there is a blank space in place of the half-width, either the sample size for that particular cell was too small for the sampling errors to be calculated, or no estimate was calculable. In the former case, this implies that the estimate itself is likely to be based on too small a sample size to be regarded as a viable estimate. In some circumstances, a confidence interval will still be computed for relatively small sample sizes. Occasionally the $95 \%$ confidence interval halfwidth will exceed the value of its associated estimate, in which circumstances the parameter being estimated can be regarded as not being significantly different than zero. As with all sample-based sampling error calculations, the confidence intervals themselves are estimated and have error associated with them.

Where a classifying variable category is not listed, the estimates in the right-hand columns refer to all levels of that variable in aggregate. For example, the first row (with missing purpose and mode) refers to the overall national estimate of distance travelled and trips made.

Table B1: Sampling errors by travel mode and overall trip purpose

| Purpose | Mode | $95 \%$ confidence intervals |  |

## Appendix C: Data classification

## C.1: Alcohol consumption

Respondents were asked to indicate the number and type of drinks consumed in each session, using the photographic show cards in Appendix G. Total alcohol consumption was calculated using the volume and alcohol content information shown in Table C1 below. Where a range of alcohol content was possible within a beverage type (eg the alcohol content of beer ranges from $3.5 \%$ to $5 \%$ ), a typical average value was assumed.

Table C1: Data used in calculating alcohol consumption

| Beverage type | Photo label (on show card) | Description | Volume (litres) | \% alcohol | Alcohol content (g) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Beer/ lager on tap | A | 200 ml glass | 0.200 | 4.0 | 8.00 |
|  | B | Half pint | 0.300 | 4.0 | 12.00 |
|  | C | Half pint | 0.300 | 4.0 | 12.00 |
|  | D | Handle | 0.500 | 4.0 | 20.00 |
|  | E | Jug | 1.000 | 4.0 | 40.00 |
| Beer/ lager in cans or bottles | F | Can | 0.330 | 4.5 | 14.85 |
|  | G | Stubby | 0.375 | 4.5 | 16.88 |
|  | H | Bottle | 0.750 | 4.5 | 33.75 |
| Beer: home brew | 1 | Glass | 0.300 | 6.0 | 18.00 |
|  | J | Bottle | 0.750 | 6.0 | 45.00 |
| Low alcohol beer (above 1.17\% alcohol) | K | 200ml glass | 0.200 | 2.5 | 5.00 |
|  | L | 300ml glass | 0.300 | 2.5 | 7.50 |
|  | M | Can | 0.330 | 2.5 | 8.25 |
|  | N | Stubby | 0.375 | 2.5 | 9.38 |
| Low alcohol beer (1.17\% alcohol or less) | 0 | 200ml glass | 0.200 | 1.0 | 2.00 |
|  | P | 300ml glass | 0.300 | 1.0 | 3.00 |
|  | Q | Can | 0.330 | 1.0 | 3.30 |
| Cider | R | Half pint | 0.300 | 6.0 | 18.00 |
|  | S | Handle | 0.500 | 6.0 | 30.00 |
|  | T | Stubby | 0.375 | 6.0 | 22.50 |
| Alcoholic soda | U | Bottle | 0.375 | 7.0 | 26.25 |
| Spirits | V | Double | 0.050 | 40.0 | 20.00 |
|  | W | 375 ml bottle | 0.375 | 40.0 | 150.00 |
|  | X | 750 ml bottle | 0.750 | 40.0 | 300.00 |
| Cocktails | Y | Clear | 4*nip |  | 40.00 |
|  | Z | Creamy | 2*nip |  | 20.00 |
| Wine | 1 | Glass | 0.100 | 12.0 | 12.00 |
|  | 2 | Bottle | 0.750 | 12.0 | 90.00 |
| Sherry/ port/ vermouth | 3 | Bottle | 0.750 | 20.0 | 150.00 |
|  | 4 | Glass sherry | 0.060 | 20.0 | 12.00 |
|  | 5 | Glass port | 0.060 | 20.0 | 12.00 |
| Liqueurs | 6 | Glass | 0.030 | 40.0 | 12.00 |

These figures were used in estimating total alcohol consumption. Drivers were considered to be likely to be alcohol impaired if they had consumed more than the maximum number of standard drinks compatible with an average person staying under the legal blood alcohol limit, between the beginning of their drinking session and the beginning of their driving trip. The calculations allowed for an a rate of absorption and elimination from the bloodstream of one standard drink per hour. (One standard drink contains 10 g of alcohol). This number of standard drinks is as follows:
Males: 5 in first hour, and one per hour thereafter
Females: 3.5 in the first hour, and one per hour thereafter.
Information about the way in which alcohol consumption was spread over the drinking session was not available, so a constant drinking rate was assumed. This may underestimate the number of people who were unfit to drive (eg where someone consumed most of his/ her drinks in the last hour of a drinking session).

## C2: Ethnicity

Respondents aged 15 and over were asked to indicate which of several ethnic groups best described them. Respondents who indicated that their preferred group was not on the list (NZ Maori, NZ European or Pakeha, Other European, Samoan, Tongan) were asked to specify their preferred group. These were manually coded into the additional categories Cook Island Maori, Niuean, Other Pacific, East \& South East Asia, India/ NZ Indian/ Pakistan, Other. Individuals who specified more than one ethnicity were allocated to single categories according to the following Statistics NZ priority order ${ }^{7}$ :

If NZ Maori is one of the groups reported, then assign to NZ Maori;
Otherwise, if any Pacific Island group is one of the groups reported, then assign to Pacific Island;
Otherwise, if any Asian group is one of the groups reported, then assign to Asian; Otherwise, if any group other than a European group is one of the groups reported, then assign to Other Ethnic Groups;
Otherwise, assign to European.
Asian is ranked after NZ Maori and Pacific Island groups, but before European groups because priority is given to non-European groups, but special priority is given to NZ Maori and Pacific Island groups.
23 people refused to state their ethnic origin, and a further 201 people stated 'New Zealander', 'Kiwi' or 'NZ citizen' only. These made up $2.1 \%$ of the sample.
Due to an error in questionnaire design, children under 15 were not asked their ethnic origin. However, the dataset contains information on family relationships. Where possible, the ethnicity of children was imputed from that of their parent(s), using the hierarchy above. The child was assigned the ethnicity of the parent whose ethnicity was highest on the list above. That is to say, if either parent was Maori, the child's ethnicity was recorded as Maori; otherwise, if either parent was of Pacific Island origin, the child's ethnicity was recorded as the appropriate Pacific category, and so on.

[^5]
## Appendix D: Travel Survey Datasets

Approximately 14,000 people were interviewed from 7,000 randomly sampled households over the period of a year between June 1997 and July 1998, and during April and May 1999 (some Auckland households only).
This produced a number of inter-related files. They are :
\(\left.$$
\begin{array}{ll}\text { Household } & \begin{array}{l}\text { Details about the household and its response to the survey } \\
\text { Person } \\
\text { Details about people in the household }\end{array}
$$ <br>
Information such as age, gender, occupation, income, driving <br>

experience, accident totals, work and school locations\end{array}\right\}\)| Type, make, model, year, CCs and owner of vehicles driven during |
| :--- |
| the survey |

The inter-relationships are :

The information in the Address and Trips files was used to calculate digitised trip distances for driver, passenger, cycle, bus and taxi trips. These distances have been added to each trip record.
The Address and Accident Locations files are not available outside the LTSA.

## Filenames and linking variables ${ }^{8}$

## Trip linking

Consider a commuter travelling from Johnsonville to Wellington. They walk to the station, travel on the train to Wellington, walk to the bus terminal, catch a bus to Willis St then walk to their office building. This would be in the trip files as five separate legs, the first four having a trip purpose of "change mode". When you are dealing with any of the first four legs you do not know what the overall trip purpose is.
To overcome this the trip legs are LINKED. Each trip leg gains information on the overall purpose of the trip, the trip number within the travel day, the number of legs in the trip, and the leg number within the trip.

[^6]
## Data file descriptions

The following tables name and describe the variables in the data files. The 'Data type' column indicates whether a variable is numeric ( N ), a character variable (A4 indicates a character variable of length 4) or SAS date format (sasdate).
Household data (HH)

| Variable name SAMNO | Data type <br> N | Description |  |
| :---: | :---: | :---: | :---: |
|  |  | Household number |  |
|  |  | The first three (or four) digits are an Ampt Applied Research code for the meshblock used. The last three digits refer to the dwelling within the meshblock. |  |

## Variable name Data type Description

| SRVPASS | N | Purpose of trip leg was to accompany someone else ( $1=\mathrm{Y}, 2=\mathrm{N}$ ) |
| :---: | :---: | :---: |
| TRMODE | N | Travel Mode |
|  |  | Walk 0 |
|  |  | Vehicle driver 1 |
|  |  | Vehicle passenger 2 |
|  |  | Cycle 3 |
|  |  | Train 4 |
|  |  | Bus 5 |
|  |  | Ferry 6 |
|  |  | Plane 7 |
|  |  | Taxi 8 |
|  |  | Other 9 |
| TRPEOPL | N | Number of People in Vehicle |
| TRWPARK | N | Where Parked (1-7) |
| BESTDIST | N | Digitised distance if available and credible; else reported dist |
| CALCDIST | N | Digitised distance |
| TRDISTN | N | Reported distance in km |
| TRPEDES | N | Nr of Pedestrian Crossings Used |
| TRROADS | N | Number of Roads Crossed |
| JOURNEY | N | Journey number (Journey = series of trips whose purpose is change mode) |
| LEGNO | N | Leg within journey |
| NUMLEGS | N | Total number of legs in this journey |
| PURPOSE | A1 | Overall journey purpose (same codes as TRACTIV) |
| JSTADDNO | A3 | Journey origin address number |
| JADDNO | A3 | Journey destination address number |
| JLEAVE | A4 | Journey departure time (HHMM) |
| JLEAVEHR | N | Journey departure time in hours (includes decimal fraction part) |
| JARRIV | A4 | Journey arrival time (HHMM) |
| JARRIVHR | N | Journey arrival time in hours (includes decimal fraction part) |
| JSTART | A1 | Destination/ purpose of previous journey |
| JDESTN | A1 | Destination/ purpose of current journey |
| VEHICLE | A1 | Vehicle Number (1-6 are vehicles owned by household, A-F are other vehicles used by household members) |
| TRWEIGHT | N | Trip weight (for 2 days travel) |
| ANNWGT1 | N | Weight for annual trip estimates (Trweight * 365/2) |
| ANNWGT2 | N | Annwgt1/ 1000000 (gives million trips per year) |
| RGAN1W1 to 10 | N | Random group weights used for trips per year |
| RGAN2W1 to 10 | N | Random group weights used for million trips per year |
| RG1 to RG10 | N | Random group identifiers (10 iterations) used for sampling error calculation |
| RGTWGT1 to 10 |  | Random group weights used for trips |

## Vehicle data (VE)

| Variable name | Data type | Description |  |

## Accident data (AC)

| Variable name | Data type | Description |
| :---: | :---: | :---: |
| SAMNO | N | Household number |
| PERSON | N | Person number |
| AXNO | N | Accident number |
| AXDATE | A6 | Date of Accident (DDMMYY - could be 99MMYY, 9999YY) |
| AXDAYWK | A1 | Day of Week (1=Monday) |
| AXTIME | A4 | Time of Day of Accident (HHMM) |
| ADDNO | N | Accident Address Number |
| AXFAT | N | Were there any fatalities ( $1=y \mathrm{es}, 2=\mathrm{no}$ ) |
| AXHOSP | N | Was anyone hospitalised ( $1=y \mathrm{yes}, 2=\mathrm{no}$ ) |
| RESPHOSP | N | Was respondent hospitalised ( $1=y$ es, 2=no) |
| AXINJ | N | Was anyone injured ( $1=y$ es, $2=n \mathrm{no}$ ) |
| RESPINJ | N | Was respondent injured ( $1=\mathrm{Yes}, 2=\mathrm{No}$ ) |
| AXHOWIN | N | How was respondent involved |
|  |  | Driver of a motor vehicle |
|  |  | Driver of a motorbike |
|  |  | Passenger in a motor vehicle |
|  |  | Passenger on a motorbike |
|  |  | On a bicycle |
|  |  | Walking |
|  |  | Not there at the time |
| AXHHVEH | N | Was a household vehicle involved (1=yes, 2=no) |
| VEHICLE | A1 | Household vehicle number |
| NOCARS | N | Number of Cars involved |
| NOVANS | N | Number of Vans involved |
| NOTRUCKS | N | Number of Trucks involved |
| NOMC | N | Number of Motorbikes involved |
| NOCYC | N | Number of Bicycles involved |
| NOPED | N | Number of Pedestrians involved |
| NOOTHER | N | Number of Other Objects involved |
| AXPLATE | A2 | First 2 characters of vehicle number plate |
| AXTYPE | N | Accident Type: |
|  |  | One vehicle hitting parked vehicle only |
|  |  | One vehicle hitting the back of another (not parked) |
|  |  | Head on collision |
|  |  | Vehicles hitting each other at an angle |
|  |  | Hitting an object |
|  |  | Driver lost control |
|  |  | Other |
| AXSPEED | N | Speed limit zone where crash occured |
|  |  | $70 \mathrm{~km} / \mathrm{h}$ or less |
|  |  | Greater than $70 \mathrm{~km} / \mathrm{h}$ |
|  |  | Car park, not relevant |
| AXREPOR | N | Was accident reported to Police ( $1=y \mathrm{e}$, $2=$ no, $3=\mathrm{DK}$ ) |

| Variable name Data type <br> AXCOST N | Damage Cost |  |
| :--- | :--- | :--- |
|  | Nothing at all | 1 |
|  | Less than $\$ 1,000$ | 2 |
|  | $\$ 1,001-\$ 5,000$ | 3 |
|  | $\$ 5,001-\$ 10,000$ | 4 |
|  | More than $\$ 10,000$ | 5 |

## Address data (AA)

| Variable name | Data typeDescription <br> SAMNO | N |
| :--- | :--- | :--- |
| ADDNO | Household number |  |
| AXADDRS | N | Address number |
| ( | A77 | 'Identification' for address (delim ' $N$ ') |
|  | $($ | Street Number (delim ' $N$ ') |

## Accident locations (AXADDR)

| Variable name | Data type Description |  |
| :--- | :--- | :--- |
| SAMNO | N | Household number |
| ADDNO | N | Accident address number |
| AXADDR | A110 | Address (lines separated by ${ }^{\wedge}$ ) |

## Geocoded trip data (GTRIPS)

| Variable name | Data type | Description |
| :---: | :---: | :---: |
| SAMNO | N | Household number |
| PERSON | N | Person number |
| TRIPDAY | N | Travel day no |
| TRIPNO | N | Trip Number |
| UNIQUEMA | N | Map Identifier |
| FROM_ADD | N | Origin address number |
| TO_ADDRE | N | Destination address number |
| HOW_GOT_ | N | Trip mode |
| ROUTE_TA | A200 | Route taken (Q=quickest route) |
| DEPART_T | N | Departure time (HHMM) |
| ARRIVAL | N | Arrival time (HHMM) |
| USER_SUP | N | Distance estimated by respondent |
| USERDIST | A200 | Unit used for respondent-estimated distance |
| GDIST | N | Digitised distance (km) |
| TIME | N | Calculated duration of trip (minutes) |
| TRIP_COM | A200 | Comments |

## Geocoded address data (GADDR)

| Variable name | Data type | Description |
| :---: | :---: | :---: |
| SAMNO | N | Household number |
| ADDNO | N | Address number |
| MAPID | N | Map ID |
| MAP_NAME | A50 | Map name |
| MESHBLK | A20 | Meshblock number (prefixed by "MB ") |
| IDENTIFI | A75 | Identification of address (eg Home, Middlemore hospital, etc) |
| NAME | A50 | Name of building |
| STREET | A50 | Street name |
| STRT_VAL | N | Street name validated? (1=yes) |
| SUBURB | A50 | Suburb name |
| SUBRBVAL | N | Suburb name validated (1=yes) |
| INTST | A50 | Name of intersecting street |
| INTSTVAL | N | Intersecting street name validated ( $1=y \mathrm{es}$ ) |
| CAL_MAPN | A50 | Critchlow Associates map reference |
| ROADLENG | N | Road length |
| GEO_X | N | Geocoded grid reference |
| GEO_Y | N | Geocoded grid reference |
| GEO_ACCU | A50 | Comment |

## Appendix E: Description of 1989/90 NZ Household Travel Survey ${ }^{9}$

Response rates

| Response (1989/90) | 1989/90 Travel Survey |  |  |
| :--- | ---: | ---: | ---: |
|  | Addresses in <br> sample | \% of all <br> addresses | \% of eligible <br> households |
| Full response | 3102 | $70.0 \%$ | $75.2 \%$ |
| Partial response (see Note) | 310 | $7.0 \%$ | $7.5 \%$ |
| Non-response | 711 | $16.0 \%$ | $17.2 \%$ |
| Total eligible households | 4123 | $93.0 \%$ | $100.0 \%$ |
| Sample loss (eg non-dwelling, dwelling under <br> construction, demolished, derelict or vacant) | 311 | $7.0 \%$ |  |
| Total households in survey | 4434 | $100.0 \%$ |  |

Note: 'Partial response' refers to households in which some post-travel interviews were completed but in which one or more members refused or was unable to participate.

## Method

The previous travel survey was carried out over a full year from July 1989 to June 1990. An initial letter, which described the aims and content of the survey, was sent to the selected households. Next an interviewer called at the address to gather household information, explain the purpose of the survey and leave a memory jogger for each participant to record travel details over the two consecutive travel days selected for that household. Finally, as soon as possible after the travel days, the interviewer returned to conduct the survey. All travel for household occupants aged 5 years or over was recorded. The trip data were recorded in enough detail to allow the trip distances to be measured by tracing out the trip route on a map overlaying a digitising board.

## Sample design

The sample was constructed to fulfil initial estimation requirements of the survey. These were:
(i) Travel estimation for NZ as a whole
(ii) Travel estimation for large cities individually
(iii) Travel estimation for sub-periods of the year of 3 months or more for NZ as a whole.
The other main consideration was the minimisation of survey costs, achieved by constructing a survey so that interviewers did not need to travel long distances between households.
All the Major Urban Areas (MUAs: population greater than 45,000 as at the 1986 census) were surveyed throughout the year. So estimates can be made of annual travel for individual cities. The rest of NZ was surveyed in chunks called Territorial Local Authorities (TLAs). The TLAs are smaller population centres, and were sampled with probabilities proportional to their sizes. So a town of 10,000 had twice the chance of selection of a town of 5,000 . A couple of TLAs were large enough to be surveyed throughout the year; the remainder were surveyed over a period of weeks or months, depending on their sizes.

[^7]To minimise travelling for the interviewers, meshblocks (groups of households in the the same neighbourhood) were selected within the MUAs and sampled TLAs by simple random sampling. Every fifth (or in some cases tenth) household was surveyed within the selected meshblocks. All people in these households aged 5 years or older were asked to provide travel data for the 2 designated days.
A more detailed description of the sample design is included in Ministry of Transport (1992).

## Weights

Since the sample was not a simple random sample of the population, an arithmetic average of sample observations was not appropriate for estimating the population mean. Weighted averages were used. The inverse of the probability of selection of a sample unit, whether a household or a person, was used as the weight for the sample unit.

## Sampling errors

The random group method of variance estimation was used for estimating the confidence intervals. In this method the sample is divided into a number of random groups. Weights are estimated separately for each random grouping. The spread in the estimates obtained from the separate groups was used to provide an estimate of the variance of the estimate obtained from the overall sample.
